Passive System Maintenance Checklist: basins, berms & earthworks

Twice Yearly Inspection (before monsoon & winter rains)

Collection System:

- □ Ensure inflow system is free of debris:
 - If have gutters, clean and remove debris from gutters and downspouts so water flows properly during rainfall event.
 - Clean inflow to basins, remove any debris/sediment blocking water from flowing into basin.

Earthworks:

- □ Inspect basins:
 - \circ $\;$ Look for signs of erosion, especially near inlet and outlet.
 - Consider adding rocks (~6" diameter) to stabilize.
 - Add mulch to basins if needed. Mulch will help with weed control.
 - \circ $\;$ Keep basins weed-free to maximize infiltration.

Annual Inspection

Collection System:

□ Roof: water flows and drains as intended

Earthworks:

- □ Remove any obstructions (debris, rocks, sediment, weeds) from Inlet, outlet and infiltration basin.
- □ Remove invasive plant species from earthworks.
- Ensure berms & basins are intact. Rebuild berms and basin walls if necessary.
- □ If basin infiltration is slowing, inspect for fine sediments and remove from bottom of basin if necessary.

Every 2-4 years

- □ Remove fine sediments from inlet, outlet and infiltration basin.
- □ Ensure that the ground/ soil level at the bottom of the infiltration basin is lower than the level of the inlet.
- □ Improve soil health by adding organic matter to the infiltration basin.
- Clear overhanging vegetation and trees over roof surface and always use best pruning practice.
 - For best pruning practice, please visit: <u>LANDSCAPE</u> <u>MAINTENANCE MANUAL</u>.

Updated 2.29.24

Active System Maintenance Checklist: tanks & cisterns

Quarterly Inspection

Storage Tank:

- □ Check all pipe fittings for leaks.
- $\hfill\square$ Routine mosquito prevention treatment:
 - Examine all screens and seals. Repair any openings.
 - Use biological or chemical products that are harmless to other living creatures and plant life (e.g. Mosquito Dunks).

Twice Yearly Inspection (before monsoon & winter rains)

Collection System:

- □ Ensure inflow system is free of debris:
 - Clean and remove debris from gutters, downspouts, and inflow pipe so water flows properly during rainfall event.
 - Clean first flush diverters (after every rain event).
- □ Check adequate outflow/overflow:
 - \circ $\;$ Visually inspect that overflow spout is clear of debris.
 - Best practice: Overflow should be used as a resource and directed to a basin for beneficial use to water vegetation.
 - Tank overflow or site runoff should not compromise the t ank or property foundation. Tank overflow should be 10' from foundation.

Annual Inspection

Collection System:

- $\hfill\square$ Roof: water flows and drains as intended
- □ Gutters and pipes: sized for maximum water capture

Storage Tank:

- □ Inspect tank/cistern and pipes for cracks or leakage.
- □ Inspect and clean storage tank lids:

Updated 2.29.24

- Replace vents and screens on inflow and outflow spigots as needed.
- Check mosquito screens: replace, patch holes or gaps immediately.
- □ Inspect condition of overflow pipes, overflow filter path, and/or secondary runoff reduction practices; keep free of any debris.
- □ Replace any damaged or defective system components.
- $\hfill\square$ Check there is adequate access to the tank and its interior.
 - Ensure you have enough space to visually inspect the exterior of the tank and allow adequate space for any potential repairs.
 - Ensure you have adequate access to get inside the tank for inspection, cleaning, or repair.

Power Supply:

- □ For pressurized/ pump systems, schedule required yearly backflow inspection by a certified backflow professional.
- □ If applicable, check power supply; ensure pump and electrical system working properly.

Every 2-4 years

- □ Inspect tanks for sediment buildup.
 - May require blowdown to remove sediment from bottom of tank.
- Clear overhanging vegetation and trees over roof surface and always use best pruning practice.
 - For best pruning practice, please visit: <u>LANDSCAPE</u> <u>MAINTENANCE MANUAL</u>.
- $\hfill\square$ Protect plastic cisterns and exposed piping from UV radiation:
 - Touch-up/re-paint exposed pipe.
