

# Climate Change and Arizona: Challenge and Opportunity

Jonathan Overpeck  
The University of Arizona

IPCC, 2007

# Global Warming is *unequivocal*

Since 1970, rise in:

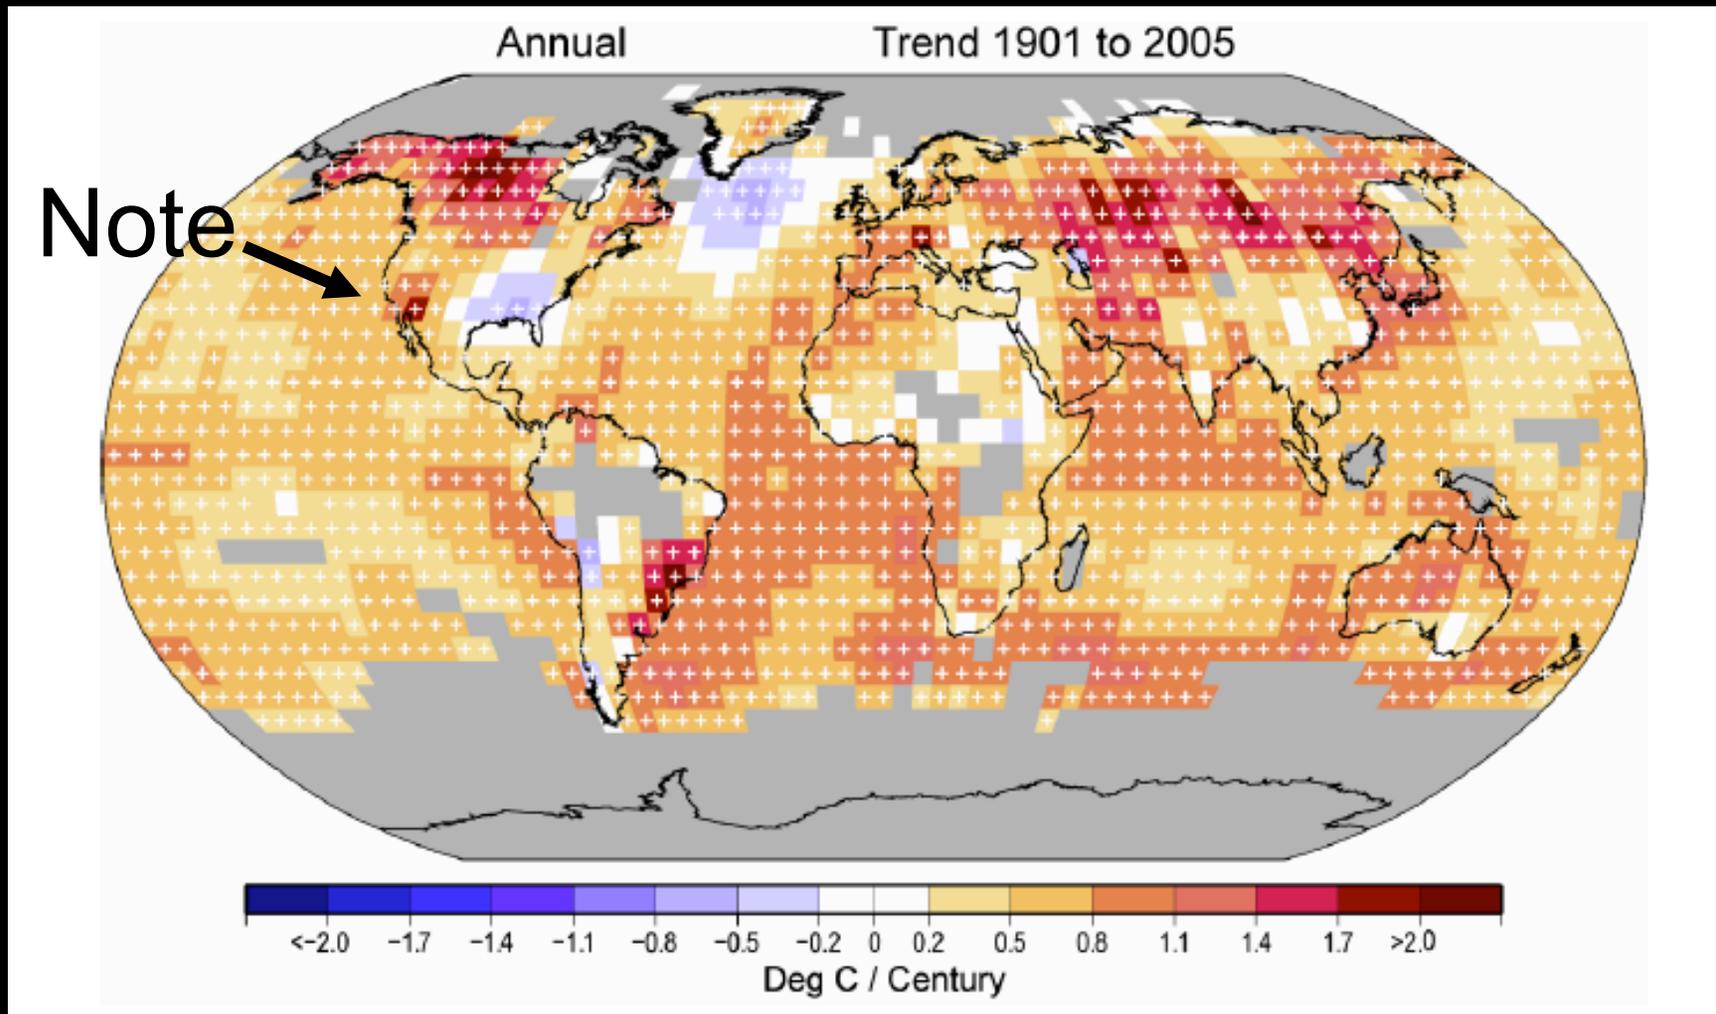

- Global surface temperatures
- Extreme high temperatures
- Heat waves
- Lower atmosphere temperatures
- Global sea-surface temperatures
- Ocean heat content
- Water vapor
- Extratropical precipitation
- Rainfall intensity
- Drought
- Hurricane intensity
- Global sea level

Decrease in:

- NH Snow extent
- Arctic sea ice
- Glaciers
- Cold temperatures

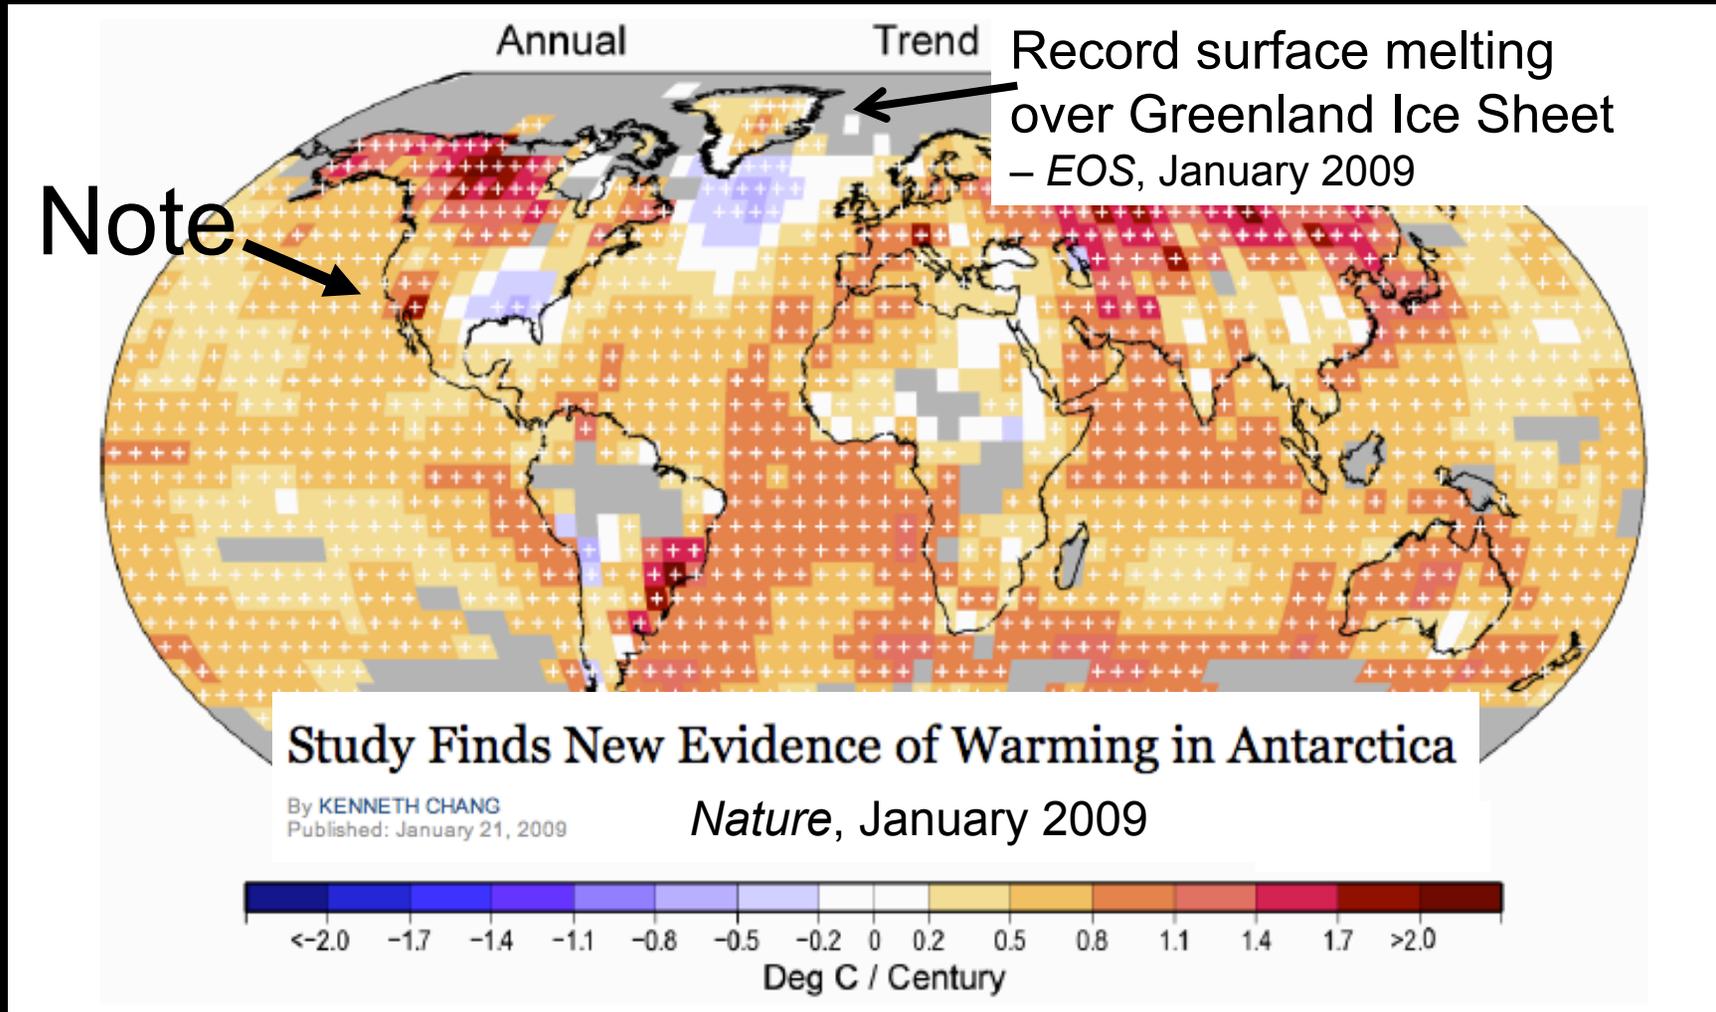

# *The Earth has warmed almost everywhere*

Temperature trend from 1901 to 2005

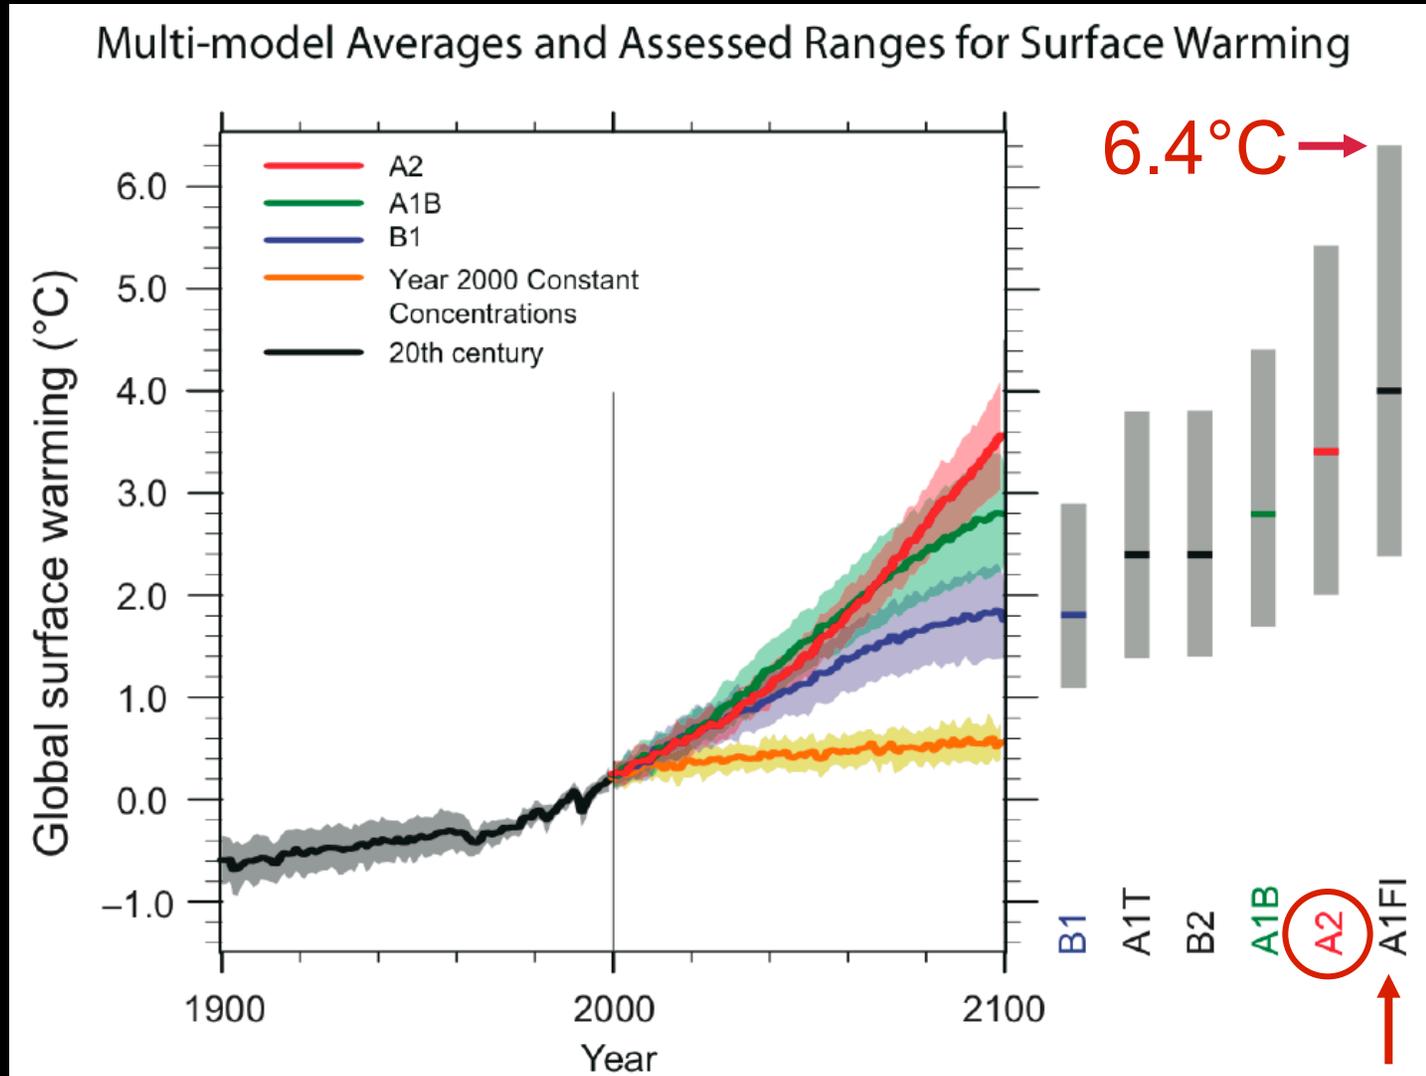

2009 update... the story is not getting any better...

Temperature trend from 1901 to 2005

IPCC, 2007

# Projected future global warming

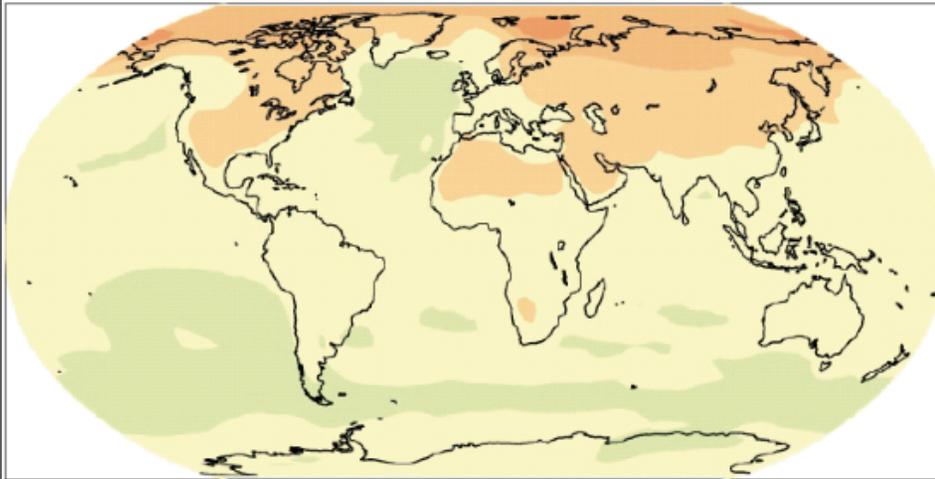

Likely  
warming  
depends on  
emissions  
scenario

Presently  
increasing  
than on the  
fast-track A2  
scenario

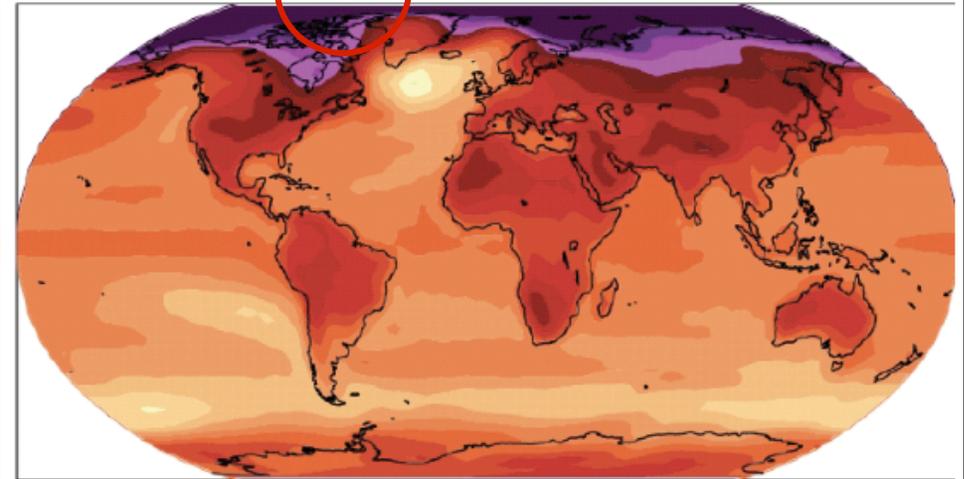

*Bottom line... A2 scenario and average of all models yields 3.5°C global average warming*

*Warming will be more over land, and at higher latitudes (e.g., in the **Western U.S.** and the poles)*

A2: 2020-2029

A2: 2090-2099

(Differences relative to 1980-99)

*NOTE: Some models project even warmer climates if carbon emissions are not curbed – even double above*

*Turning to the Southwest...*

*With climate change, there may  
be winners and losers...*

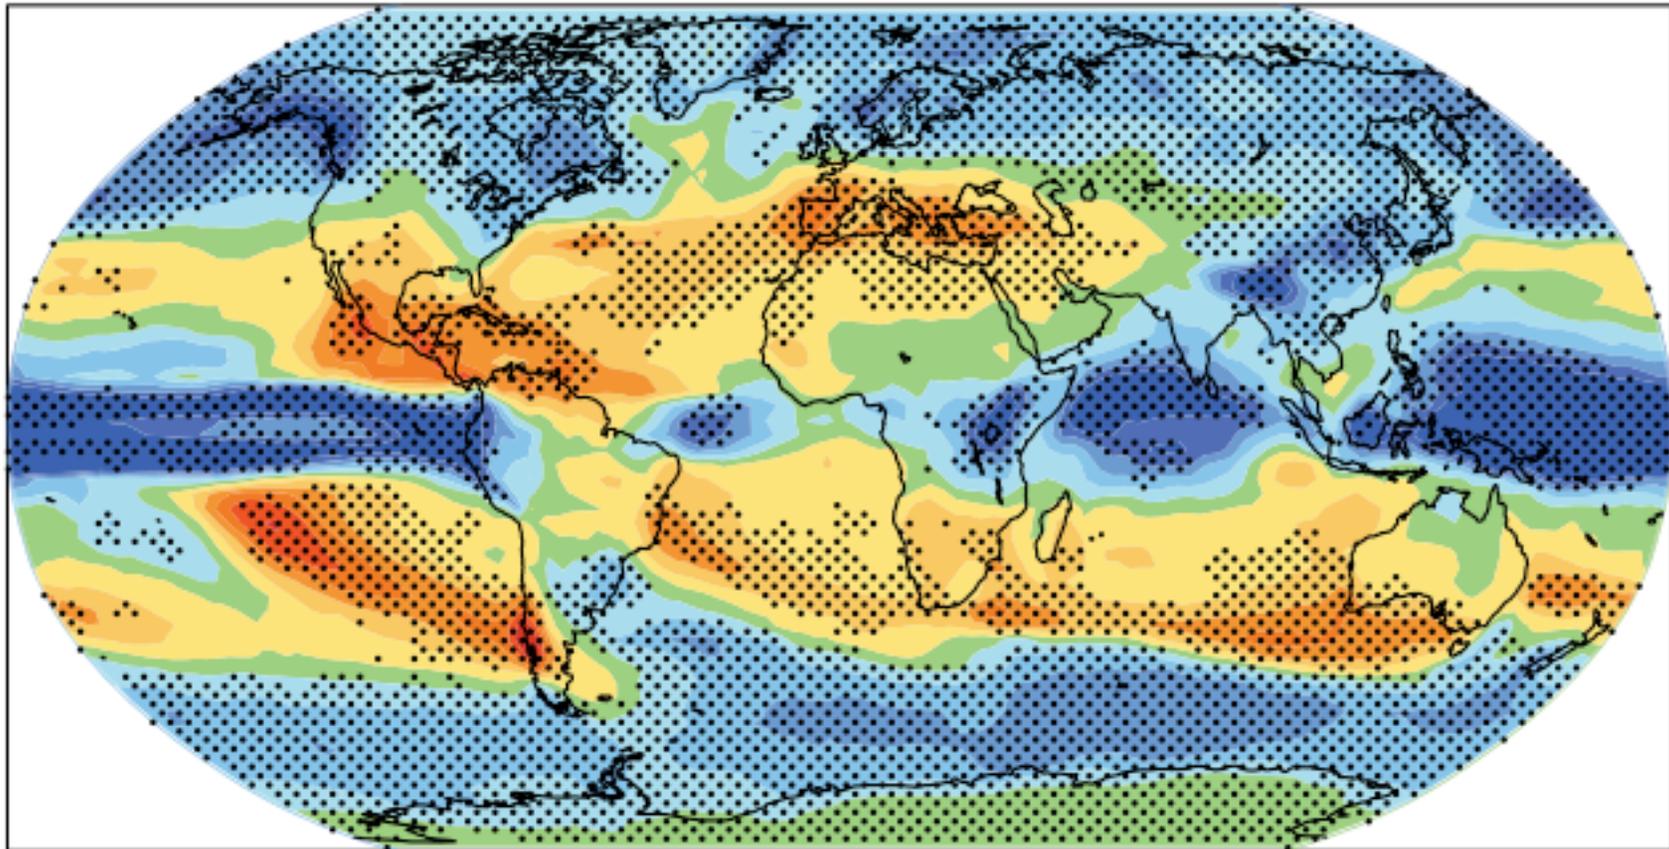

## Climate change hotspots in the United States

Noah S. Diffenbaugh,<sup>1</sup> Filippo Giorgi,<sup>2</sup> and Jeremy S. Pal<sup>3</sup>

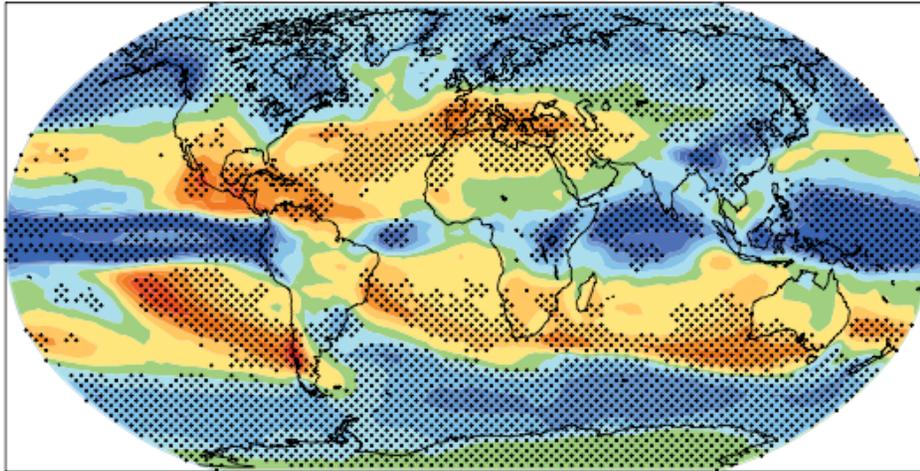

*(Geophysical Research Letters, 2008)*

*“Areas of the southwestern United States and northern Mexico are the most persistent hotspots”*

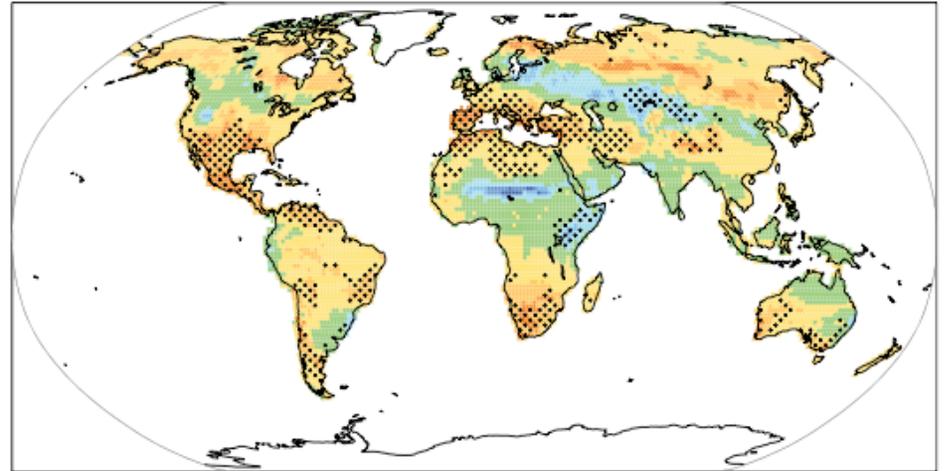

## a) Precipitation

a) Precipitation

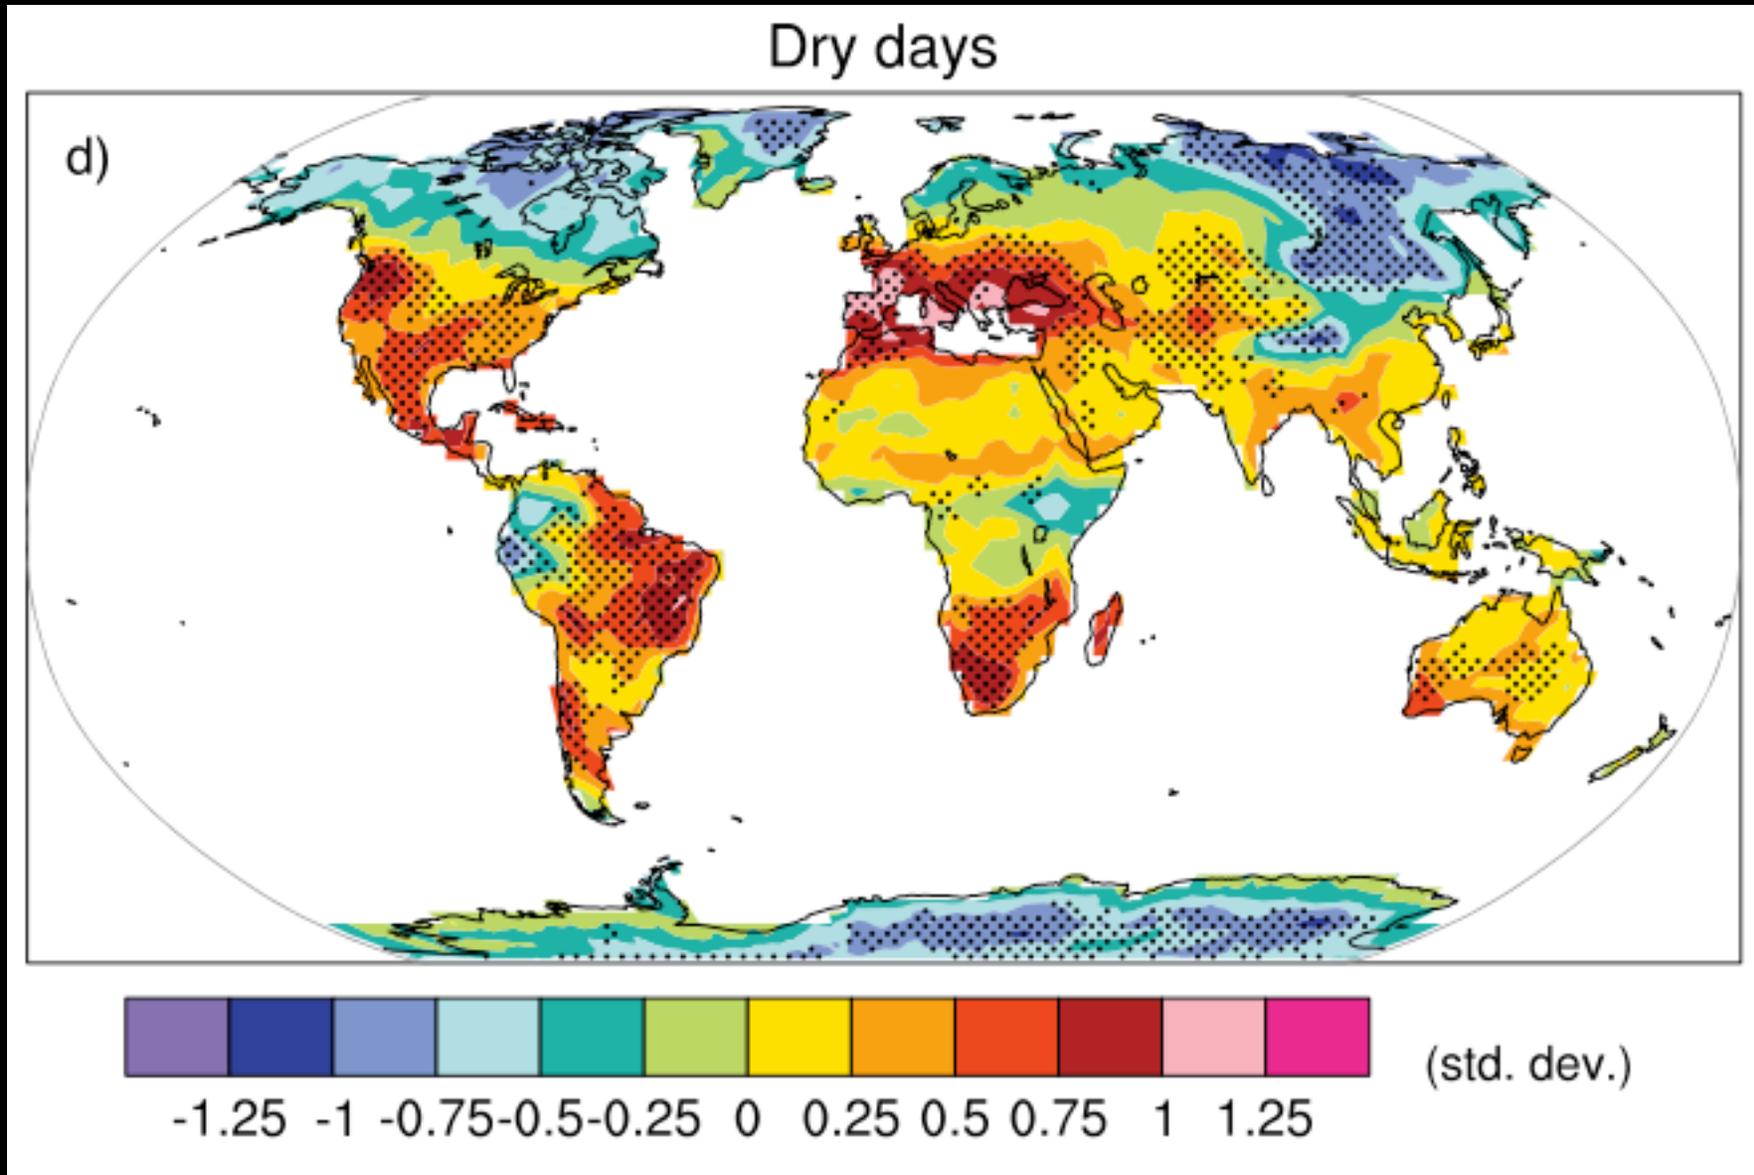

b) Soil moisture

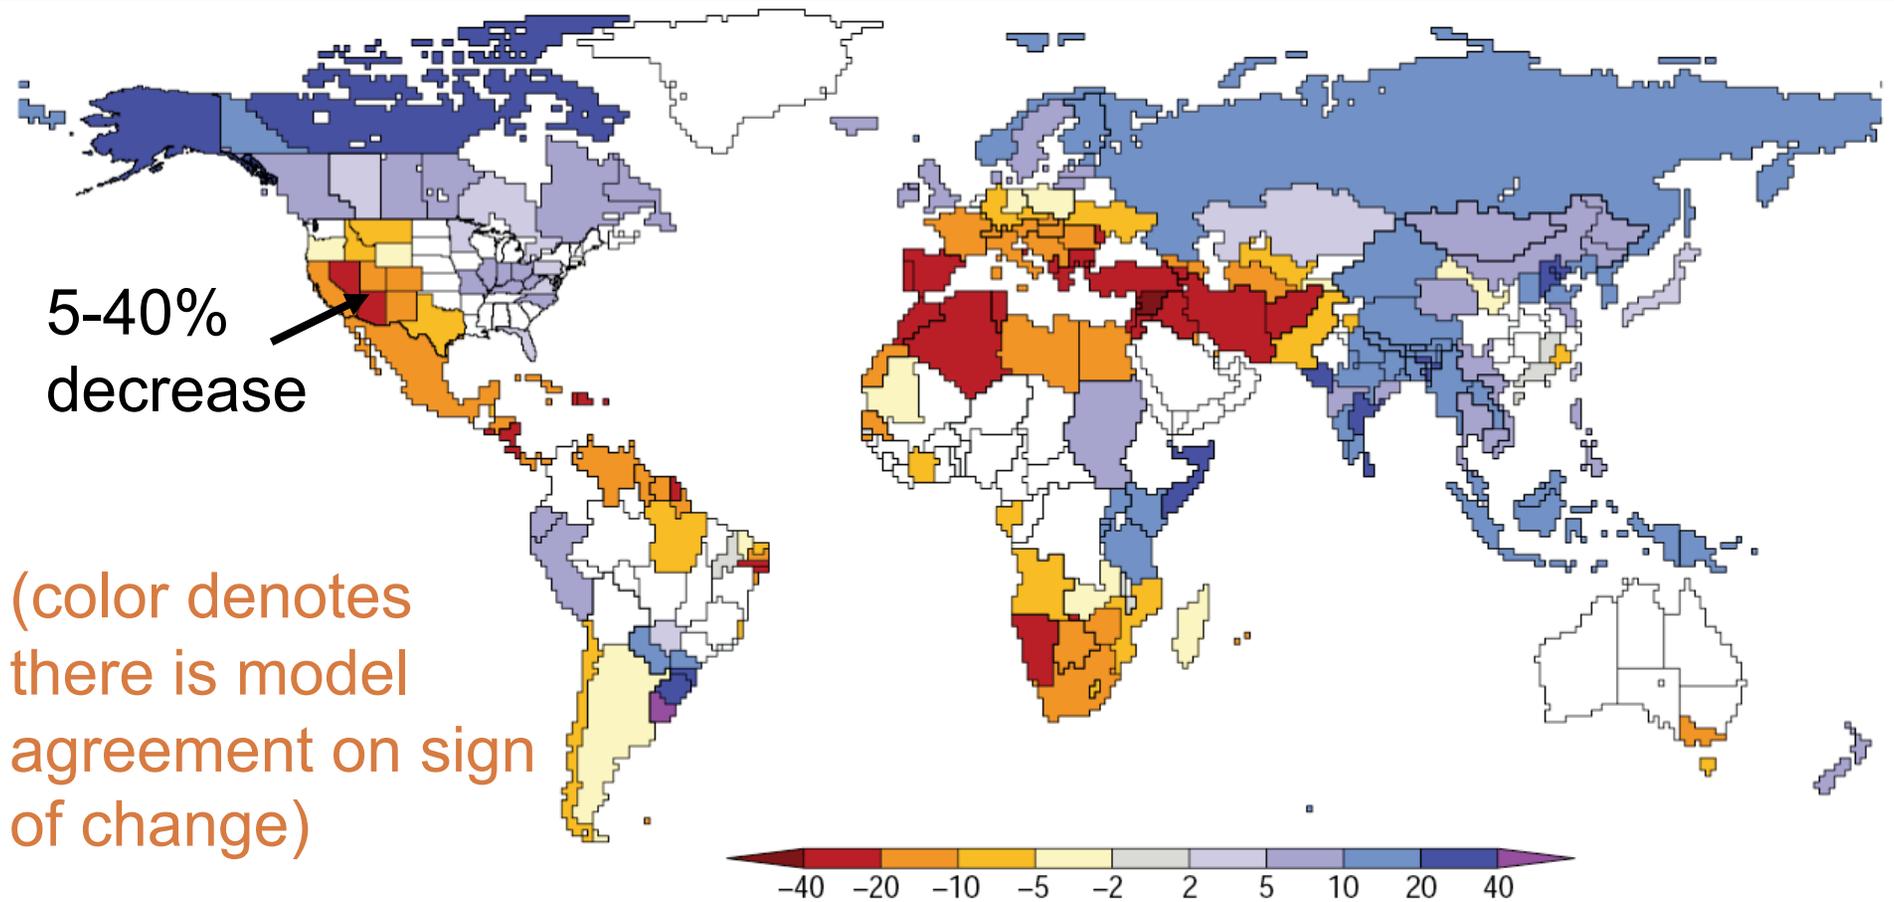

It appears that the Earth's dry zones will get drier, and...

# Dry zones will also see more drought too

*IPCC, 2007*

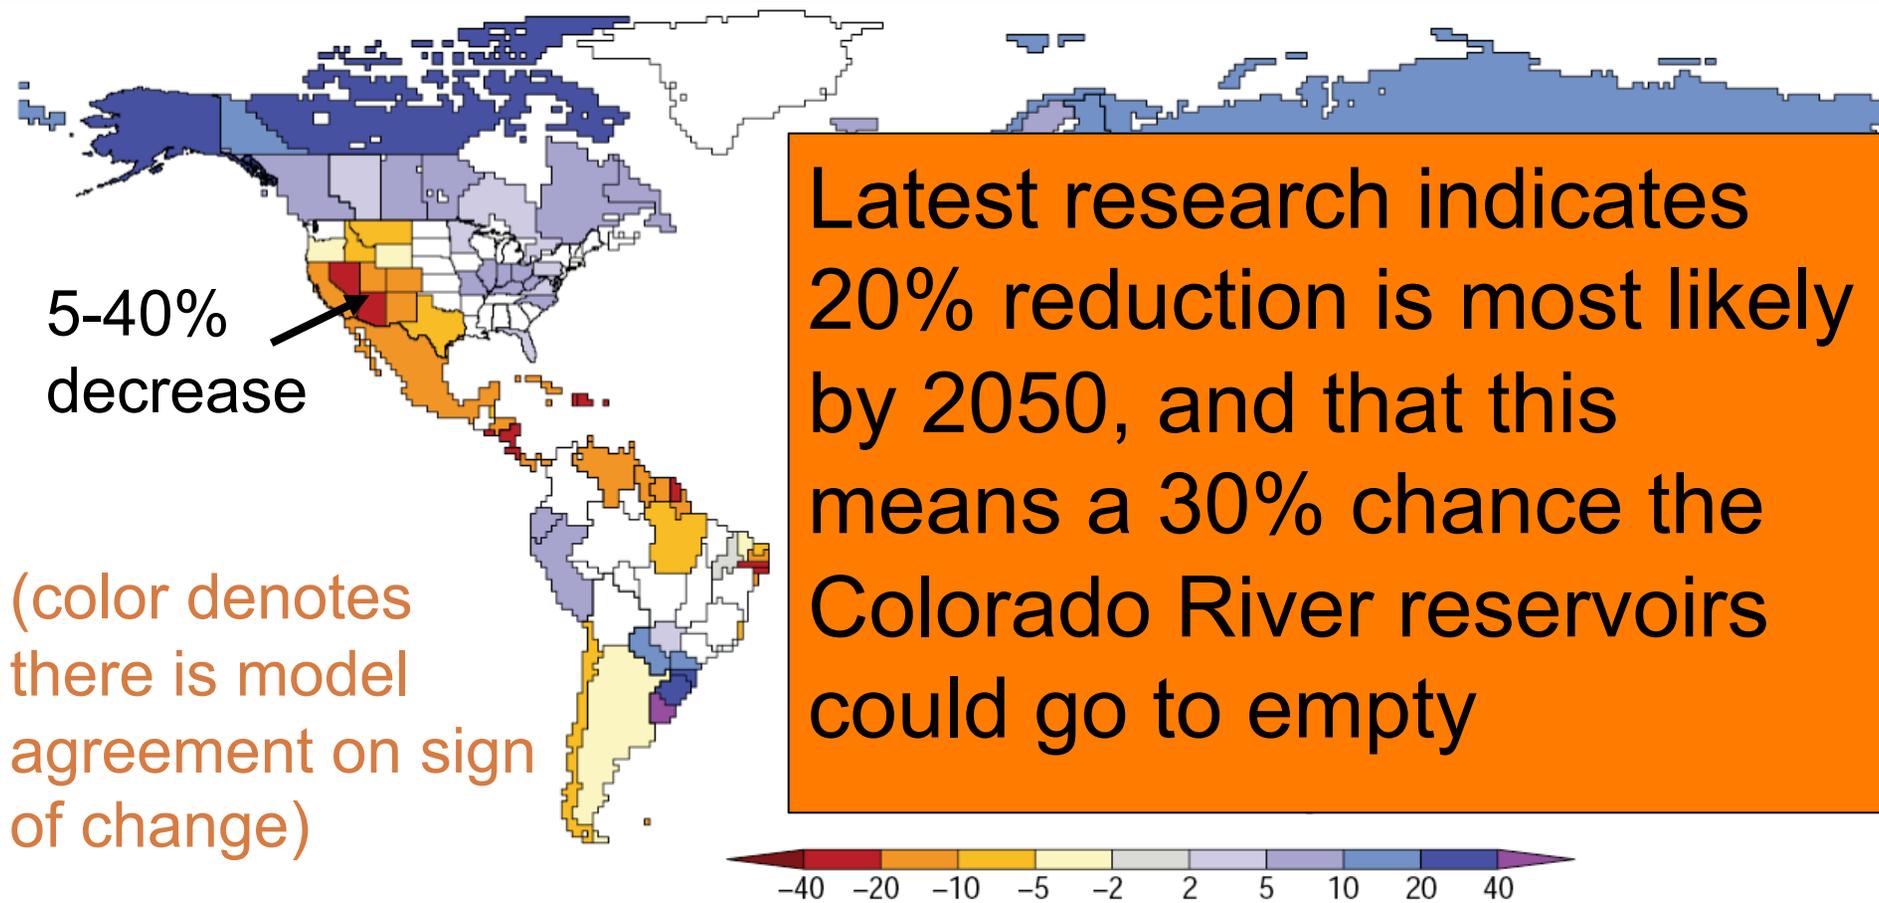

# Colorado River Flow Likely to Decrease even given the A1B reduced-emission scenario

% Change in Terrestrial Runoff by **mid-21st Century**

Milly et al., 2008

# Colorado River Flow Likely to Decrease even given the A1B reduced-emission scenario

% Change in Terrestrial Runoff by **mid-21st Century**

Milly et al., 2008

*That's what is  
projected by theory  
and climate  
models....*

*What's actually  
happening?*

David McNew

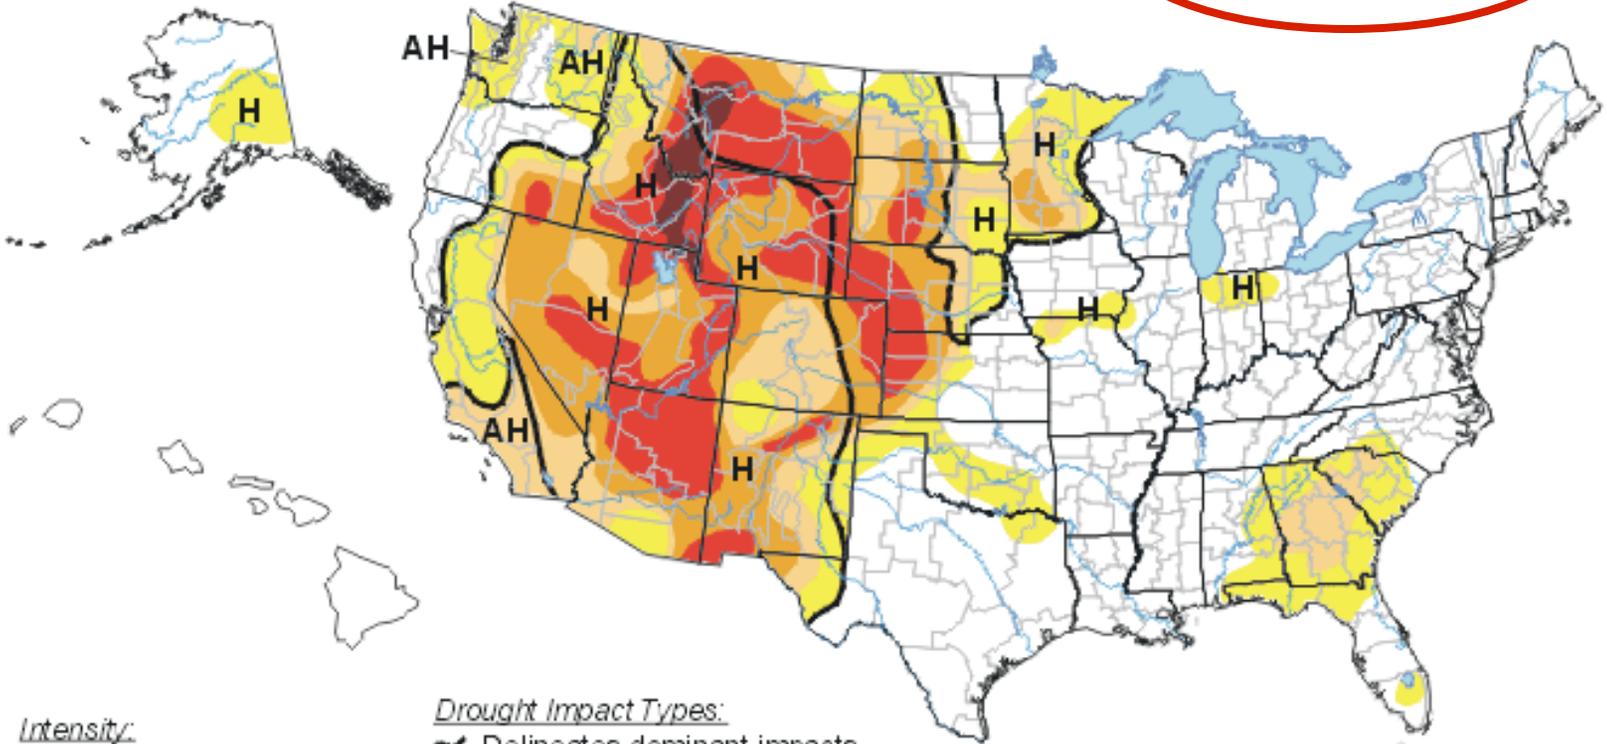

<http://www.npr.org>

*The current western drought began in the late 1990's...*

# U.S. Drought Monitor

May 18, 2004

Valid 8 a.m. EDT

Intensity:

-  D0 Abnormally Dry
-  D1 Drought - Moderate
-  D2 Drought - Severe
-  D3 Drought - Extreme
-  D4 Drought - Exceptional

Drought Impact Types:

-  Delineates dominant impacts
- A = Agricultural (crops, pastures, grasslands)
- H = Hydrological (water)
- A, H = Agricultural and Hydrological
- (No type = Both impacts)

*The Drought Monitor focuses on broad-scale conditions. Local conditions may vary. See accompanying text summary for forecast statements.*

<http://drought.unl.edu/dm>

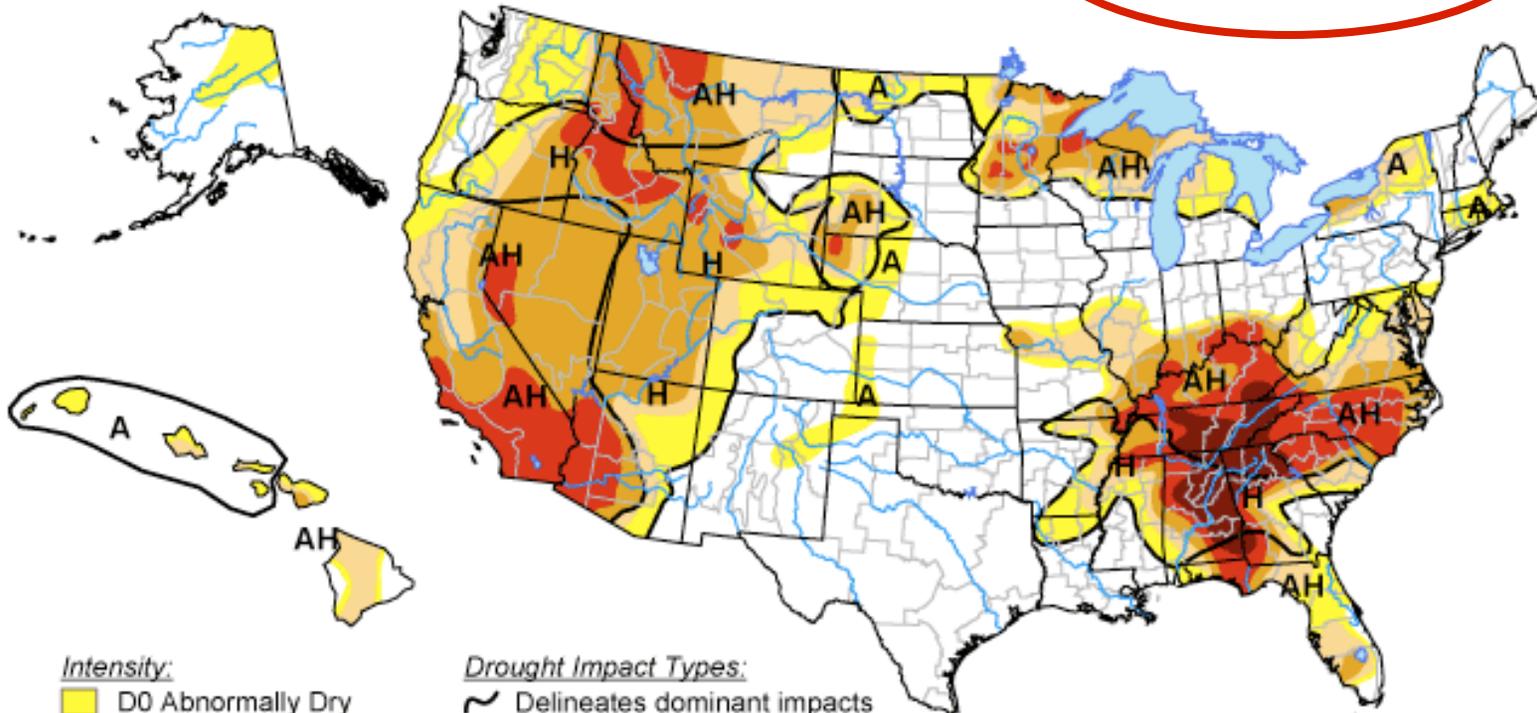

**Released Thursday, May 20, 2004**

**Author: David Miskus, JAWF/CP C/NOAA**

*As we exited summer 2007, the drought persisted...*

# U.S. Drought Monitor

September 18, 2007  
Valid 8 a.m. EDT

Intensity:

- D0 Abnormally Dry
- D1 Drought - Moderate
- D2 Drought - Severe
- D3 Drought - Extreme
- D4 Drought - Exceptional

Drought Impact Types:

- Delineates dominant impacts
- A = Agricultural (crops, pastures, grasslands)
- H = Hydrological (water)

*The Drought Monitor focuses on broad-scale conditions. Local conditions may vary. See accompanying text summary for forecast statements.*

<http://drought.unl.edu/dm>

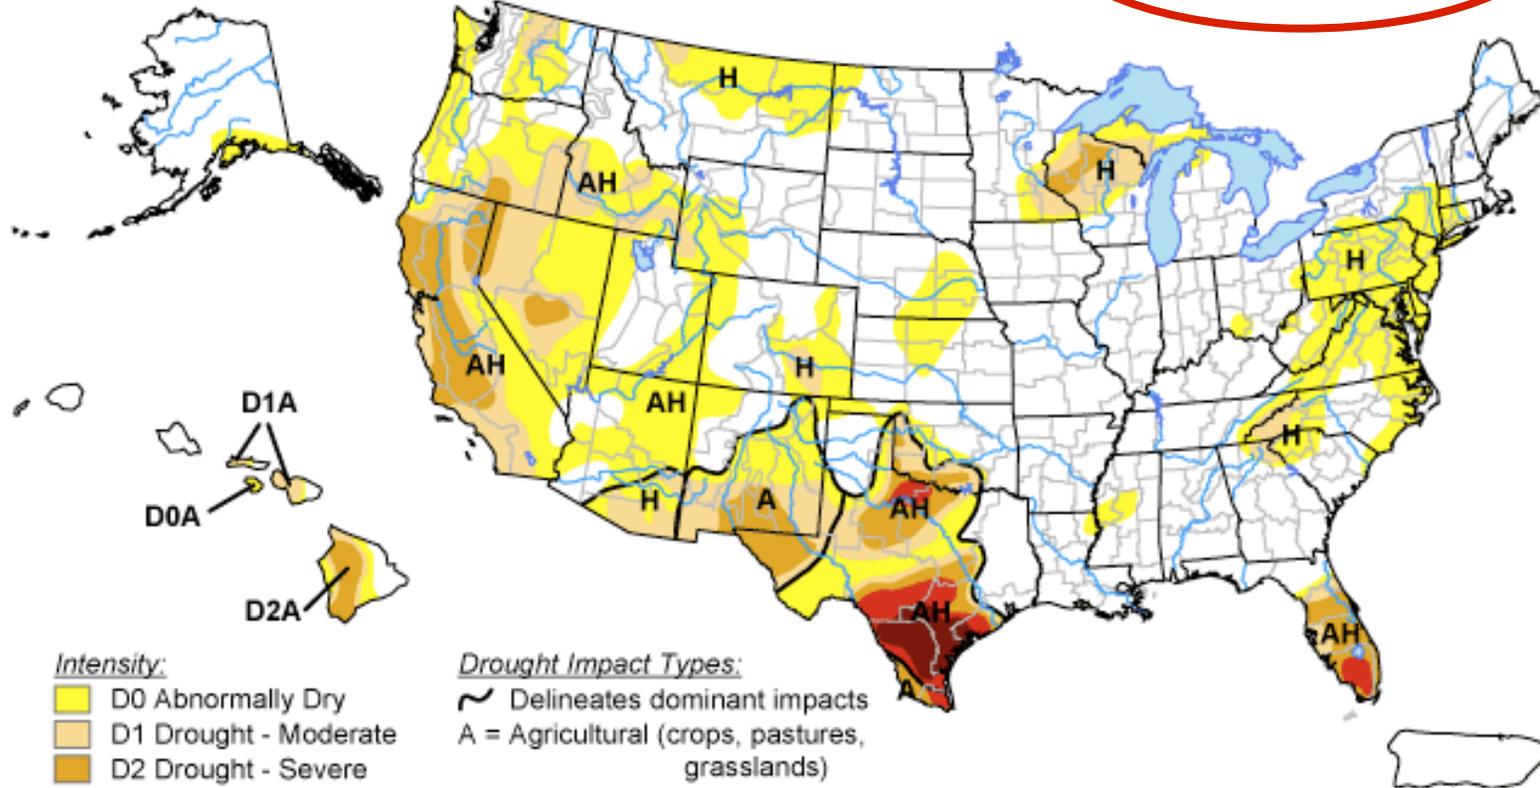

Released Thursday, September 20, 2007  
Author: David Miskus, JAWF/CPC/NOAA

***And even with our “wet” 2007/8 winter and summer in 2008, the drought still persists...***

# **U.S. Drought Monitor**

**April 28, 2009**  
Valid 8 a.m. EDT

Intensity:

-  D0 Abnormally Dry
-  D1 Drought - Moderate
-  D2 Drought - Severe
-  D3 Drought - Extreme
-  D4 Drought - Exceptional

Drought Impact Types:

-  Delineates dominant impacts
- A = Agricultural (crops, pastures, grasslands)
- H = Hydrological (water)

*The Drought Monitor focuses on broad-scale conditions. Local conditions may vary. See accompanying text summary for forecast statements.*

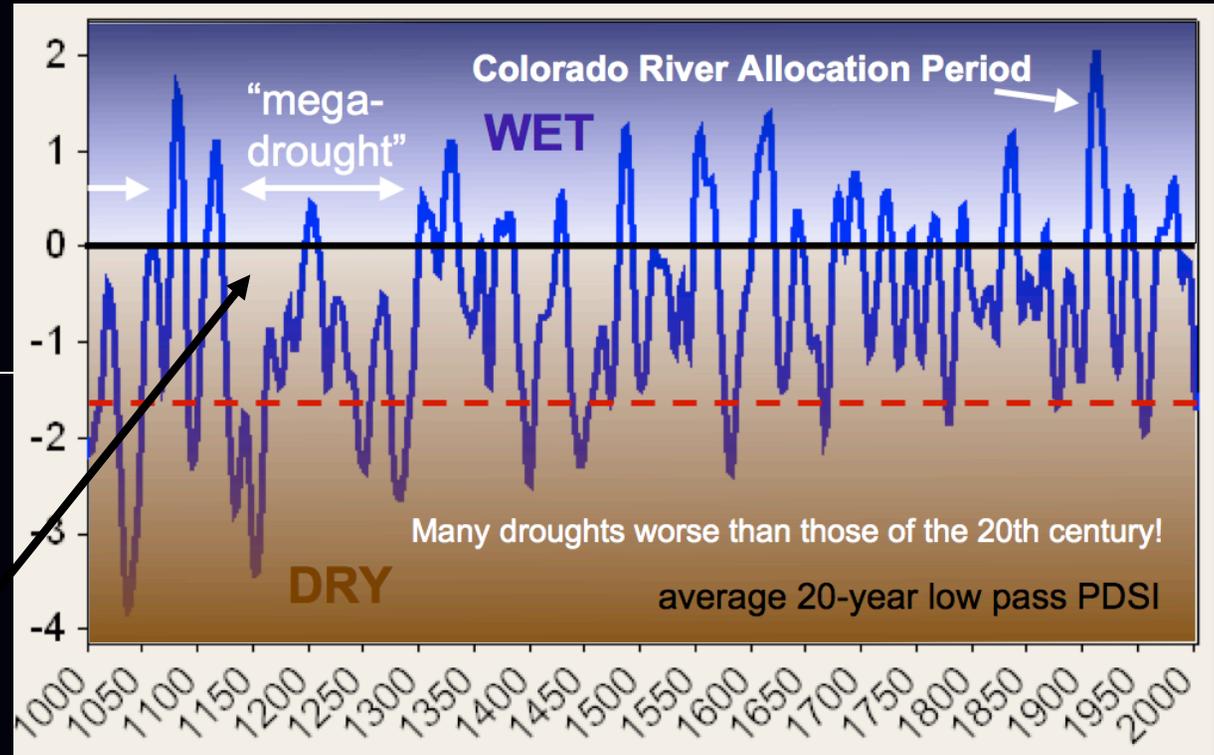

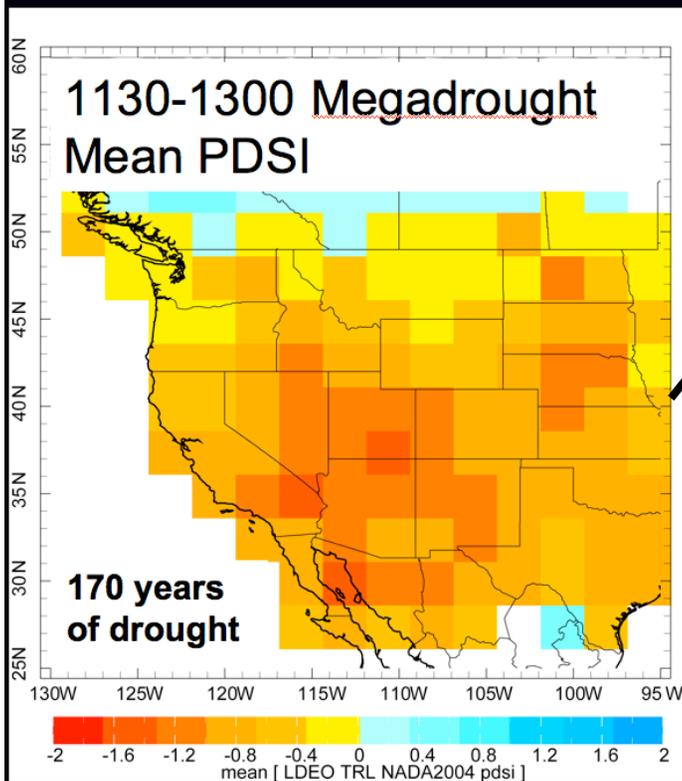

<http://drought.unl.edu/dm>

**Released Thursday, April 30, 2009**

**Author: Brad Rippey, U.S. Department of Agriculture**

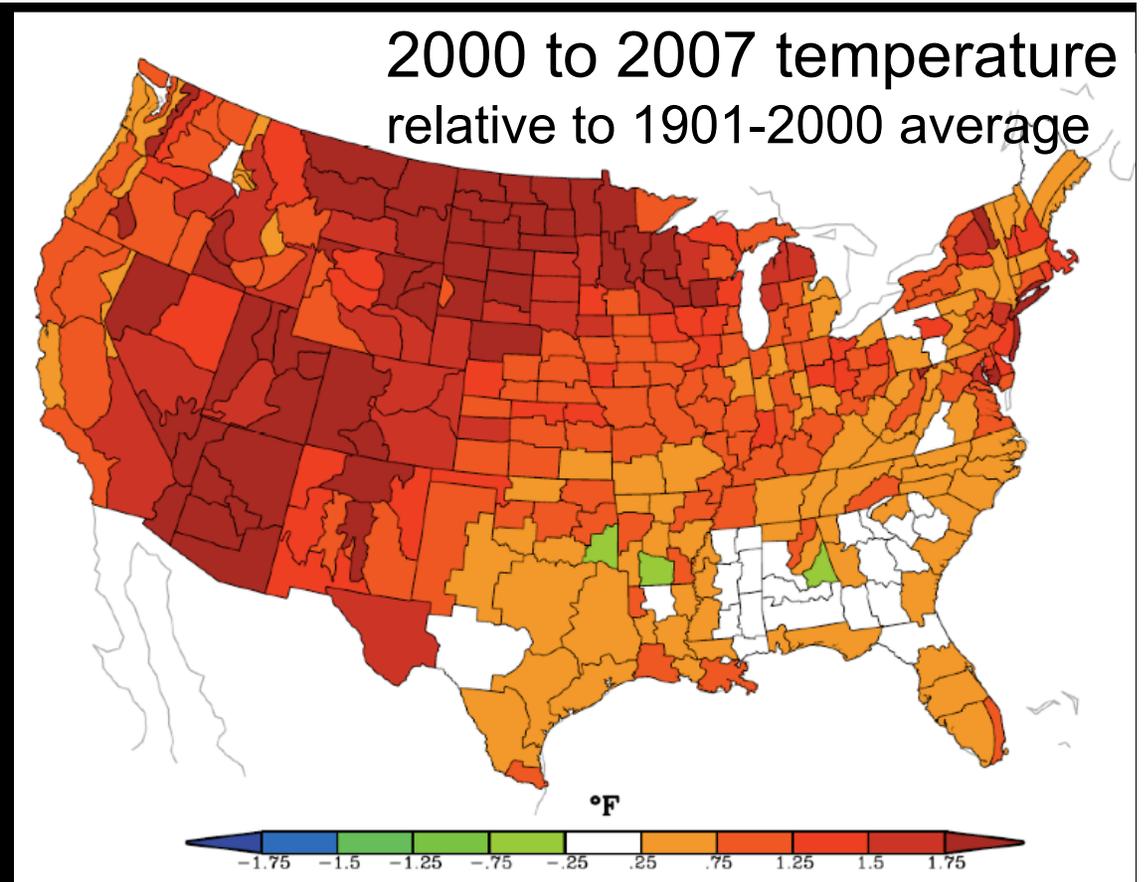

Climate change adaptation is also a “no-regrets” option that could reduce our vulnerability to natural drought as well

After Cook et al., *Science*, 2004

*But it is very likely that future droughts will be unlike those of the past...*

*Future droughts will be significantly hotter*

*Parts of the West have already warmed more than 2°F relative to average 20th century temperatures*

(map from M. Hoerling, NOAA)

# Conclusions

- Global warming (etc.) is very real - and impacting the Southwest (and the West more generally)
  - Humans are causing the problem - little doubt
  - More climate change (e.g., warming and drought) is a sure bet – *and natural variability could make it worse with a megadrought*
- 

Arizona needs to plan how to *adapt* to climate change

# Conclusions

- Global warming (etc.) is very real - and impacting the Southwest (and the West more generally)
  - Humans are causing the problem - little doubt
  - More climate change (e.g., warming and drought) is a sure bet – *and natural variability could make it worse with a megadrought*
- 

Colorado population projected to increase 55% (2.6M) by 2030

Arizona population (5M) projected to double by 2030

Possible ???

California population to go up 37% (up 12M) by 2030

# *But we must also be a leader in reducing the causes of climate change...*

- Conservation and increased efficiency
- **Carbon-free electricity** - coal with carbon capture, wind, solar, hydropower, geothermal
- **Carbon-free fuels** - advanced biofuels, hydrogen generated with carbon-free electricity
- **Natural carbon sinks** - forestry and agricultural soils
- **Nuclear?** - problems with waste problems with NIMBY, and... problems with proliferation

Photo: J. Overpeck

Note: there are thousands of potential small hydropower projects in Canada and the US. Only the largest, which define QRA boundaries are shown on this map. Small hydropower resources in Canada and incremental hydropower resources in the US that fall within QRA boundaries are quantified, even though they are not shown on this map.

**LEGEND**

-  Qualified resource area
-  Canadian hydropower resources
-  Conventional discovered geothermal

**Solar thermal resource**

Direct normal insolation (kWh/sqmtr/day)

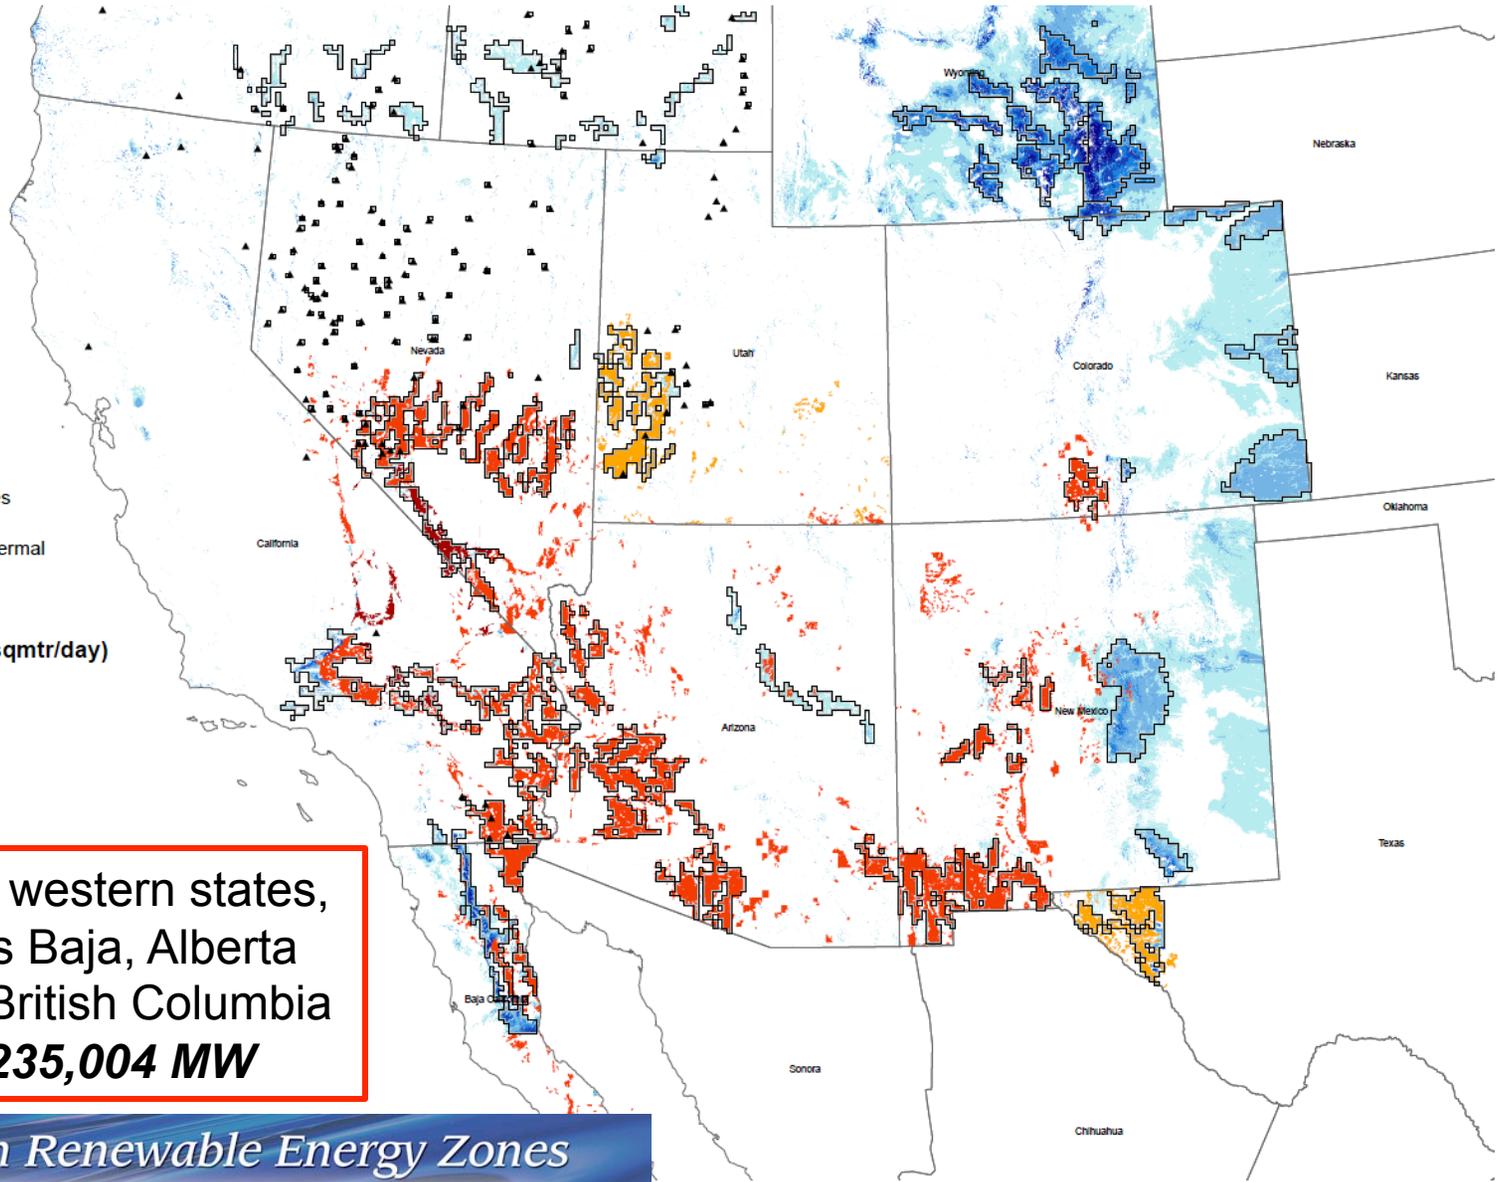

-  6.5 - 7.0
-  7.0 - 7.5
-  7.5 +

**Wind resource**

Wind power class

-  3
-  4
-  5
-  6
-  7

Total western states,  
 plus Baja, Alberta  
 and British Columbia  
**235,004 MW**

*Western Renewable Energy Zones*

*A joint initiative of the Western Governors' Association and U.S. Department of Energy*

<http://www.westgov.org/wga/initiatives/wrez/comments.htm>

Arizona (**Tucson!**) has the opportunity to be the market leader in technological and knowledge solutions to climate change (and drought), and to save our skin at the same time.

Arizona has the opportunity to be the market leader in technological and knowledge solutions to climate change (and drought), and to save our skin at the same time.

**Thanks...**
