POLICY AND PROCEDURES

City Of Tucson
Department of Transportation
Traffic Engineering Division
Neighborhood Traffic Management Program
201 N. Stone Avenue – 5th Floor
P.O. Box 27210
Tucson, AZ 85726-7210
520-791-4259
INTRODUCTION

The protection of neighborhood environments and quality of life depends largely on the function of residential streets. The primary function of local and collector streets that serve neighborhoods is to serve the land that abuts them. Neighborhood streets, however, also serve as routes for those who wish only to travel through the neighborhood. As a result, conflict arise between the negative impacts of unnecessary traffic on neighborhood streets and the quality of life within the neighborhood. This conflict is reflected in virtually all Tucson neighborhoods and area plans, which contain goal statements that discourage the use of neighborhood streets by nonlocal vehicular traffic. In addition to nonlocal traffic volumes, and excessive vehicular speed result in safety, noise, air quality, and visual impacts that detract from neighborhood quality of life. The overriding consideration in solving traffic problems in neighborhoods must be safety, the impacts of unnecessary traffic on the neighborhood environment, and maintaining emergency vehicle access. Convenience to the motorist is a secondary consideration in neighborhoods. This program is intended to establish a comprehensive approach to protecting Tucson neighborhoods through the management and control of traffic on neighborhood streets.

GOALS

The intent of the program is to protect neighborhoods and neighborhood quality of life through traffic management and control strategies. The goals are:

1. To protect existing neighborhood environments, cohesion, and integrity through traffic management.
2. To promote safe and comfortable travel in neighborhoods for pedestrians, bicyclists, and motorized vehicles.
3. To achieve efficient, effective, and safe movement of traffic within neighborhoods (including emergency vehicles) consistent with the intended function of the neighborhood street.
4. To provide acceptable levels of accessibility for local traffic, minimize unwanted traffic, discourage excessive speeds, and encourage opportunities for alternate modes, all in recognition of quality of life and the specific objectives of the neighborhood or area plan.
5. To maintain acceptable levels of service on the City’s arterials so as to avoid intrusion/diversion onto neighborhood collectors and local streets.
GUIDELINES

1. Neighborhood streets are defined as local or collector streets, within or adjacent to, designated neighborhoods with abutting land uses that are at least 85 percent residential when considered in segments of one-quarter mile.

2. Traffic volumes on neighborhood streets should be consistent with the density of residential development that is served by a particular neighborhood street. According to data assembled by the Institute of Transportation Engineers, single family detached residences serve as origins or destinations for five to twenty trips on a typical workday. As a general guideline, traffic volumes on neighborhood streets (total for both directions) should not exceed:

   - Local Street, Low Density - 1,000 vehicles per day or 75 vehicles per hour.
   - Local Street, High Density - 2,000 vehicles per day or 150 vehicles per hour.
   - Collector Street - 8,000 vehicles per day or 800 vehicles per hour.

Neighborhood streets with traffic volumes near or in excess of these guidelines may benefit from a study to develop, implement, and evaluate possible remedial actions.

3. Vehicle speeds on neighborhood streets generally should be:

   - Local Street - 25 miles per hour.
   - Collector Street - 30 to 35 miles per hour.

Traffic speeds in excess of these guidelines, or neighborhoods, areas, or residences experiencing “unwanted” traffic volumes on neighborhood streets may indicate the need for implementation of a traffic mitigation plan and/or possibly a traffic study to develop, implement, and evaluate remedial actions. Neighborhoods, areas, or residences experiencing "unwanted" traffic volumes on neighborhood streets may benefit from a study to develop, implement, and evaluate remedial actions. "Unwanted" traffic is defined as traffic within the neighborhood operating at excessive speeds, and excessive volume of traffic, cut-through traffic (using the neighborhood street as a shortcut or detour), or vehicles with origins or destinations outside the neighborhood area.
POLICIES

1. The intended traffic service and accessibility functions of neighborhood streets shall be consistent with the hierarchy established in the Major Streets and Routes Plan, as amended.

2. Construction or reconstruction of streets and routes shall be consistent with the right-of-way and design standards established in the Major Streets and Routes Plan, as amended.

3. Implementation of the Major Streets and Routes Plan, as amended, and the adopted Pima Association of Governments Regional Transportation Plan should continue in order to provide acceptable levels of service on key features and principal arterials, and discourage neighborhood traffic intrusion.

4. All actions with regard to implementation of any feature of the Major Streets and Routes Plan and the Regional Transportation Plan, or land use proposals adjacent to any feature, shall consider as a primary goal the protection of existing neighborhood environments, cohesion, and integrity.

5. Both key features and principal arterial routes shall be designed to prohibit, where possible, neighborhood traffic intrusion.

6. Encourage the vehicular use of major streets through:
   a. The implementation of the Major Streets and Routes Plan.
   b. The improvement of safety and capacity at major street intersections.
   c. The application of traffic control devices consistent with applicable standards and practices.
   d. Enhancement and expansion of the computerized synchronization of traffic signals.
   e. The proper spacing of traffic signals.
   f. The control of access to major streets.
   g. The posting of speed limits consistent with applicable standards and practices. New residential areas and commercial developments shall be planned and constructed to discourage neighborhood traffic intrusion.

7. The City Department of Transportation shall provide technical assistance to neighborhoods and areas to define perceived traffic problems, develop and implement cost effective actions, and evaluate the effectiveness of implemented actions to resolve identified traffic problems.

8. Traffic management and control in neighborhoods shall be consistent with applicable standards and practices, and provide for emergency vehicle access.

9. Traffic management and control in neighborhoods shall be carried out in a systems context to minimize, and, if possible, avoid negative traffic impacts on adjacent neighborhoods and areas.
TRAFFIC CALMING

The NTMP (Neighborhood Traffic Management Program) is a program designed specifically to protect the environment and quality of life in Tucson neighborhoods through the management and control of traffic on neighborhood streets. What makes this program unique is neighborhood participation: The neighborhood and the Department of Transportation - NTMP can work together to create a pleasant and safe environment in which to live.

WHAT CAN BE DONE TO CORRECT A TRAFFIC PROBLEM!

There are many comprehensive approaches to correcting a traffic problem. Some are physical and some are non-physical:

<table>
<thead>
<tr>
<th>Physical Approach:</th>
<th>Non-Physical Approach:</th>
</tr>
</thead>
<tbody>
<tr>
<td>◆ Speed Humps/Speed Tables</td>
<td>◆ Signing (Speed Limit, etc.)</td>
</tr>
<tr>
<td>◆ Traffic Circles</td>
<td>◆ Turn Prohibition</td>
</tr>
<tr>
<td>◆ Traffic Islands</td>
<td>◆ One-Way Streets</td>
</tr>
<tr>
<td>◆ Diverters</td>
<td>◆ Truck Restrictions</td>
</tr>
<tr>
<td>◆ Median Barriers</td>
<td>◆ Police Enforcements</td>
</tr>
<tr>
<td>◆ Chicanes/Chokers</td>
<td>◆ Elimination of Sight Obstruction (Trim Bushes)</td>
</tr>
<tr>
<td>◆ Forced Turns</td>
<td>◆ Parking Programs</td>
</tr>
<tr>
<td>◆ Cul-de-Sacs</td>
<td></td>
</tr>
</tbody>
</table>
PROCEDURES

HOW DOES THE PROCESS BEGIN? HOW DOES THE PROGRAM WORK?

1. The process begins when an individual requests information for solving traffic problems in their neighborhood from NTMP. A request for traffic mitigation shall be made to the NTMP office. (The area for mitigation must be within the City of Tucson Limits) In response, a packet of information will be mailed to the individual requesting the mitigation.

2. After the information is reviewed, and before any remedial actions can be implemented, a petition must be circulated in the affected neighborhood. A specific NTMP petition will be required for all traffic mitigation depending on the type of traffic mitigation being requested (i.e. Speed Hump Petition for Speed Humps).

3. A petition for traffic mitigation including speed humps, speed tables, traffic circles, chicanes, etc. will require 60% signatures of either the businesses or residents (owners or renters) of the properties petitioned.

4. A petition for street closures, diverters, median barriers, traffic islands, etc. will require 60% signatures of either the businesses or residents (owners or renters) of the properties petitioned.

5. A petition for an alley closure will require 100% signatures of (property owner's/business owners) of the properties petitioned.

6. The petitions submitted to NTMP must be our original petition, and it must represent the exact mitigation requested. The upper portion of the petition must be filled out prior to collecting signatures. Copies may be made of the original petition if additional copies are needed for obtaining signatures. You may call us (520) 791-4259 to have a specific petition mailed or e-mailed to you.

7. To be counted as 'valid', each petition signature must be legible, and it must have the full property address, signature of first and last name, printed first and last name, and the date the petition was signed. Petitions containing all of the original signatures must be returned to the NTMP office.

8. At least 60% of the residents or businesses in the affected area must support the proposed mitigation (with the exception of alley closures which require 100%). Only one signature per property is allowable. The petition is to help guarantee that the neighborhood will actively support a traffic mitigation program, and it will also give the Mayor and Council a clear indication of the neighborhood's concerns.

9. If the petition submitted to the NTMP office does not meet the percentage requirement, the contact person will be notified that additional petition signatures are needed.

10. If the petition does meet the percentage requirement, a meeting with the neighborhood and NTMP staff may be held to inform residents of the techniques and strategies to eliminate or reduce traffic problems. The residents should establish a Neighborhood Traffic Advisory Committee to work closely with the NTMP staff.

11. NTMP staff will then proceed with agency approvals for the proposed traffic mitigation plan to make sure there are no issues with drainage, emergency vehicle access, etc.

12. After the agency approvals have been completed, NTMP staff will notify the contact person by a letter of approval with modifications, if any modifications are required to be made to the proposed traffic mitigation plan, and information for completing the traffic mitigation process.
13. The traffic plan costs are paid for by the neighborhood through neighborhood contributions. It is the neighborhood's responsibility to fund the mitigation, and to hire, pay, and work directly with a licensed contractor. The construction of most mitigation plans will require an Excavation Permit and a Right-of-Way Permit.

14. Responsibility for maintaining landscaping in conformance with City of Tucson criteria on the permanent devices (chicanes, medians, traffic circles, etc.) rests with the benefited neighborhood. If the neighborhood fails to fulfill the responsibility, and the landscaping obstructs the view of traffic, becomes unsightly, or is otherwise potentially hazardous, the Department of Transportation shall have the authority to remove the landscaping.

15. All petitions submitted to NTMP will remain active for up to FOUR YEARS. After the four-year period has expired, the petition will no longer be valid, and a new petition will be required.

16. In complicated plans such as traffic islands, median barriers, diverters, alley or street closures, etc., the neighborhood may be responsible for hiring a consulting engineer.

17. Certain plans that divert traffic will need to be approved by Mayor and Council.

18. The removal process for any traffic mitigation plan that has been installed, will consist of a petition with at least 60% of the petitioned area approving the removal of the traffic mitigation. Additionally, the neighborhood requesting the removal of the traffic mitigation will be responsible for funding its removal.

19. If the neighborhood would like a traffic study done for their street or neighborhood, they must contact the NTMP office and notify us of the proposed traffic study area. (A traffic study is not required for traffic mitigation.)

20. The neighborhood must hire a Traffic Count Company to do the counts and process the report. NTMP requires that the neighborhood also request a copy of the count report for our files for review for potential mitigation in the traffic study area. The neighborhood can request that the count company e-mail the count report to: neighborhoodtraffic@tucsonaz.gov

21. If you are unsure of the petition area required for the traffic mitigation plan you are requesting, please contact NTMP at (520) 791-4259.

**SPEED HUMP AND SPEED TABLE PETITION AREA**
A request for speed humps/speed tables shall be made to the NTMP office. (Please see Procedures on Page 5)

1. The petition area for speed humps shall include the properties on both sides of the street (including corner properties) between the two intersections of the street where the proposed speed hump(s) will be placed. Where an intermediate intersecting street is a cul-de-sac, all residences on the cul-de-sac will be included.

2. Signatures from at least 60% of these residents (owners or renters) and businesses will be required to initiate the mitigation process.

3. Speed humps and speed tables can only be installed on a paved street or a paved alleyway. Speed humps or speed tables cannot be installed on collector streets or arterial streets.

4. The Tucson Fire Department has designated certain streets as Secondary Emergency Routes. These are streets that are frequently used by the City of Tucson Fire Department to access their emergency destinations. In the event that the street chosen for speed hump mitigation is designated by the Fire Department as a Secondary Emergency Route, speed tables must be installed on that street.
WHAT IS THE DIFFERENCE BETWEEN A SPEED BUMP, A SPEED HUMP, AND A SPEED TABLE?

游玩 Bumps are 2' to 3' wide and 4" to 6" high. Speed Bumps are not authorized for use on public city streets. They are exclusively used in shopping centers, apartment complexes, and other private properties.

❥ Speed Humps are nationally accepted, and are used on residential streets. A speed hump is 12' wide, and 3" to 3 ½ " high. A speed hump is designed to reduce the speed of vehicles on residential streets where speeding is occurring. They are not designed to change the volume of traffic on residential streets, and do not significantly reduce cut-through traffic. For Speed humps, to be effective, they must be installed in a series, approximately 400' to 600' apart. The number of speed humps installed depends on the length of the street.

❥ Speed Tables are nationally accepted, and are used on secondary emergency streets when the Fire Department has determined that speed humps are not appropriate. A speed table is 22' wide, and 3" to 3 ½ " high. It has a flat 10' section in the middle and 6' ramps on each end.

TRAFFIC CIRCLE PETITION AREA
A request for a traffic circle shall be made to the NTMP office (Please see Procedures on Page 5)

1. The petition area for a traffic circle shall be defined by the NTMP office and will generally consist of all businesses and residences abutting, whether facing or not, all street segments radiating from intersection, or street segment in question, usually for a distance of one block, to the next intervening four-way intersection.

2. Signatures from at least 60% of these businesses and residents (owners or renters) will be required to initiate the mitigation process.

3. A traffic circle is designed to reduce the speed of vehicles on residential streets where speeding is occurring, but may have limited impact on mid-block speeds. A traffic circle is not designed to change the volume of traffic on residential streets, and does not significantly reduce cut-through traffic.

4. A traffic circle can only be installed at a paved, four-way intersection, and cannot be installed at a "T" Type intersection.

5. If there is an existing manhole at an intersection where a proposed traffic circle is being petitioned, there will be an additional cost to raise the manhole above the traffic circle so that Wastewater Management can access it.

6. All landscaping in traffic circles, chicanes, medians, etc., must be approved by a Landscape Architect prior to installation. Landscaping includes, but is not limited to, vegetation and art projects.

7. Maintenance of the landscaping in the traffic circles, chicanes, medians, etc., in most cases, will become the responsibility of the residents. If the landscaping obstructs the view of traffic, becomes unsightly, or is otherwise potentially hazardous, the Department of Transportation shall have the authority to remove the landscaping. (a traffic circle may or may not include landscaping as part of the mitigation)

8. In complicated plans such as alley or street closures, traffic islands, median barriers, diverters, etc., the neighborhood will be responsible for hiring a consulting engineer to provide a conceptual plan to the NTMP office.

9. Certain plans that divert traffic need to be approved by Mayor and Council.

10. When petitioning a new traffic circle, the neighborhood can have a choice of either Stop or Yield Signs at that 4-way intersection, unless the intersection is on a "Bike Boulevard", then Yield Signs will be required.
11. If a traffic circle already exists at an intersection, and a neighborhood wants to change the signage at that intersection from a 4-way Stop to a 4-way Yield, a petition will be required with 60% neighborhood approval. (Please see Procedures on Page 5)

12. If a traffic circle already exists at an intersection, and a neighborhood wants to change the signage at that intersection from 4-way Yield to a 4-way Stop, and if the traffic circle is not on a "Bike Boulevard", a petition will be required with 60% neighborhood approval. (Please see Procedures on Page 5)

OTHER PETITION AREAS (alley closures, street closures, diverters, median barriers, traffic islands, etc.)
A request for other petition areas, including alley closures, street closures, diverters, median barriers, traffic islands, etc., shall be made to the NTMP office. (Please see Procedures on Page 5)

1. When submitting a petition for an alley closure, signatures from 100% of the property owner's/businesses will be required.

2. When submitting a petition for street closures, diverters, median barriers, traffic islands, etc., signatures from 60% of the property owner's or renters and/or businesses will be required.

3. If an alley closure or a street closure is requested, the fire department requires that there must be at least a 65-foot turning radius at the end of the closure (32 ½ feet from the center of the radius).

4. A proposed traffic mitigation plan that diverts traffic (closures or diversions) will first need to be approved by Mayor and Council.

5. In complicated plans such as alley or street closures, diverters, median barriers, traffic islands, etc., the neighborhood may be responsible for hiring a consulting engineer to provide a conceptual plan to the NTMP office.

6. Maintenance of the landscaping in chicanes, medians, traffic circles, etc., in most cases, will become the responsibility of the residents. If the landscaping obstructs the view of traffic, becomes unsightly, or is otherwise potentially hazardous, the Department of Transportation shall have the authority to remove the landscaping.

7. A sign posted on the gate/bollard with contact information for opening the alley or street closure will be required.

8. If you are unsure about a petition area, please contact NTMP. (520) 791-4259.
WHAT IS A NEIGHBORHOOD SIGN?

To help residents and visitors identify different communities within Tucson, the City of Tucson Department of Transportation (TDOT) allows Neighborhood Identification Signs to be posted at the neighborhood’s boundaries. With this program, a neighborhood’s name and logo can be displayed on aluminum panels below the official street name signs. Neighborhood Identification Signs can be a variety of designs and colors, but must conform to sign design requirements detailed below. Neighborhoods may identify locations where Neighborhood Identification signs are to be installed, but locations must conform to Sign Installation Requirements, also detailed below. Neighborhood Identification Signs shall be installed only in neighborhoods officially recognized by the City of Tucson.

SIGN DESIGN AND FABRICATION REQUIREMENTS:

- The neighborhood is responsible for designing the Neighborhood Identification Signs and contracting with a firm to fabricate the signs according to TDOT requirements.
- TDOT shall review the sign design prior to manufacturer to verify that the sign design and colors meet TDOT requirements.
- Sign designs shall fit onto a 24 inch by 12 inch aluminum panel.
- For readability, it is recommended that lettering be no smaller than 3 inches.
- Sign shall be fabricated on 0.080 inch aluminum panels.
- Signs shall be single-sided.
- Neighborhood Identification names and logos shall use ASTM Type IV High Intensity Prismatic sheeting.
- Signs shall not use colors reserved for traffic control devices: red, black on white, and fluorescent yellow.
- Neighborhoods shall use only one sign design for all signs designating their neighborhood.
- Traffic Engineering reserves the right to reject any sign design and/or color.
- It is recommended that signs be protected with UV-protective sheeting, which can extend the life of the colors three to five years.

SIGN INSTALLATION REQUIREMENTS

- Signs that have been approved and fabricated by the neighborhood’s contractor shall be delivered to the City of Tucson Traffic Engineering Division (201 N. Stone Avenue). Traffic Engineering shall deliver the signs to the City of Tucson Sign Shop and provide direction to the Sign Shop for the installation of the Neighborhood Identification Signs.
- The City of Tucson Sign Shop shall install all Neighborhood Identification Signs and be reimbursed by the neighborhood at a rate of $50 per sign location (two back-to-back signs).
- Signs shall be installed only on the neighborhood’s boundary with street name signs.
- Signs shall be single-sided, but are generally installed in pairs, back-to-back, for viewing by two directions of traffic on the intersecting street.
- Neighborhood Identification Signs shall be installed only in neighborhoods officially recognized by the City of Tucson.
PROCEDURE

The Neighborhood Association or the Subdivision shall contact Traffic Engineering (520) 791-4259 to request a Neighborhood Identification Sign Request Form. At the time of the request, the neighborhood representative shall inform TDOT of the boundaries of the Neighborhood Association or Subdivision. After the neighborhood has decided on the design of the sign that will identify the neighborhood, the Neighborhood Identification Sign Request Form shall be completed and returned to the TDOT Traffic Engineering Division along with a sign Design Concept Drawing that completely illustrates the sign design and colors (or sign prototype). Please note that if the proposed sign is to be in color, the sign Design Concept Drawing (or prototype) shall be submitted in full color. Also, please know that the entire top portion of the request form must be completed and the entire form returned to Traffic Engineering. The completed Sign Request Form and Design Concept Drawing (or prototype) shall be sent to Traffic Engineering by U.S. Mail or email to:

City of Tucson
Traffic Engineering
Attn: NTMP Coordinator
201 N. Stone Avenue -5th Floor
P.O. Box 27210
Tucson, AZ 85726-7210 or
neighborhoodtraffic@tucsonaz.gov

DESIGN REVIEW

Traffic Engineering will review the submitted design for conformance with the design requirements outlined above. Once the design has been approved, Traffic Engineering will contact the neighborhood by an approval letter. If the sign design is not approved, a letter will be sent to the neighborhood detailing changes that are required. The neighborhood may resubmit the request until approval is granted. When sign design approval is granted, TDOT will verify with the neighborhood the number of signs and sign locations before proceeding with installation.

SIGN FABRICATION

Neighborhoods shall contract with a qualified private sign contractor to fabricate the Neighborhood Identification Signs according to TDOT requirements. The neighborhood shall pay the contractor directly for the manufacture of the signs. (Signs may be expected to cost between $50 and $100, depending on the number of colors and sign design.) All signs shall be fabricated using 24 inch by 12 inch 0.080-inch aluminum sign panel blanks and ASTM Type IV High Intensity Prismatic Sheeting. Sign that do not meet these standards shall be rejected by TDOT.

The neighborhood representative shall pick up the completed signs from their private sign contractor and deliver the completed signs to Traffic Engineering at 201 N. Stone Avenue, 5th floor. Traffic Engineering will inspect the signs to ensure that they conform to the approved Sign Design Concept, and deliver them to the City of Tucson Sign Shop, which will perform the installation. ONLY the City of Tucson Sign Shop is authorized to install Neighborhood Identification Signs. The City Sign Shop shall invoice the neighborhood for the cost to install all signs. The labor cost for sign installation is up to $50 for each sign location (two back-to-back signs.)

SIGN REPLACEMENT AND STORAGE

The Neighborhood Identification Signs are the property of the neighborhood. The City of Tucson will not replace or maintain signs that have become damaged. The City of Tucson reserves the right to remove any Neighborhood Identification Signs that have become unsightly, without replacing the signs. When signs need replacing due to vandalism, loss, or normal wear, the neighborhood shall be responsible for procuring replacement signs and delivering them to the City for installation. The neighborhood is also responsible for the storage of any extra signs being held in reserve for replacement.
NEIGHBORHOOD TRAFFIC MANAGEMENT PROGRAM

NEIGHBORHOOD SUBMITS PETITION

PETITION IS VERIFIED AND MEETS REQUIREMENT

NTMP PROCEEDS WITH AGENCY APPROVAL FOR REQUESTED MITIGATION

NTMP NOTIFIES PETITIONER WHETHER PLAN IS APPROVED AND/OR IF THERE ARE CHANGES TO THE MITIGATION

NEIGHBORHOOD PAYS FOR MITIGATION PLAN OR TRAFFIC STUDY THROUGH NEIGHBORHOOD DONATIONS

NEIGHBORHOOD HIRES CONTRACTOR MITIGATION PLAN IS CONSTRUCTED

POLICY IMPLEMENTATION PROCESS
**SEMI-DIVERTER - Typical Application**

Effective in areas where the entry of emergency vehicles is a concern, and where neighborhood traffic management is well accepted by the public.

**Effects or Impacts**

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Volume</td>
<td>Reportedly can significantly reduce volume, although subject to a relatively high violation rate of posted traffic signs.</td>
</tr>
<tr>
<td>Speed</td>
<td>Although not installed as a speed reduction device, the diversion of through traffic that formerly used the street as a short cut can significantly reduce speed on the street.</td>
</tr>
<tr>
<td>Noise, Energy, Air Quality</td>
<td>Noise reduction associated with the energy reduction of through traffic can be expected.</td>
</tr>
<tr>
<td>Safety</td>
<td>Generally, no impact on safety except what may be experienced due to reduced traffic volume on local streets. Accident potential may result from high violation rates.</td>
</tr>
<tr>
<td>Uniform Standards and Warrants</td>
<td>Not specifically covered in the MUTCD, however, recognized in basic traffic engineering standards texts and in practice. Signs and pavement markings should comply with the MUTCD.</td>
</tr>
<tr>
<td>Community Reaction</td>
<td>While local reaction is generally favorable, focus of community reaction can shift to violations of the diverter device or associated signs along with the lack of enforcement to prevent such violations.</td>
</tr>
</tbody>
</table>
TRAFFIC CIRCLE - Typical Application

Reported to be effective at intersections with relatively high accident experience.

**Effects or Impacts**

| Volume | Reduction of traffic volume is dependent upon the system of residential traffic management techniques and devices in the area. From a distance, the traffic circle may appear as an obstruction to traffic. If diverters have been encountered by drivers in other areas of the city, they may turn away from the circle prior to the circle. Volume reductions are typically limited unless a series of circles and diverters are placed along a route. |
| Speed | Reduction in speed is generally noted in the area of the traffic circle, however, the device may have only limited impact on mid-block speeds. |
| Noise, Energy, Air Quality | Noise reduction is associated with the reduction in volume experienced. There is evidence that traffic circles are effective in reducing vehicle collisions at intersections. Traffic circles may present a hazard to bicyclists and pedestrians by bringing cars and trucks closer to the curb, but are normally not a problem. Design provisions must be made for emergency vehicles and city service vehicles. |
| Safety | Traffic circles in neighborhoods are not specifically covered in the MUTCD; however, they are recognized in basic traffic engineering texts and in practice. |
| Uniform Standards and Warrants | There has been mixed reaction to traffic circles. Residents near the intersection perceive a reduction in traffic speed; others may see them mainly as a nuisance. |
FORCED TURN CHANNELIZATION-Typical Application

Effective at the intersection of a collector and/or a local street, where traffic flow on the collector street is basically unaffected (or even enhanced) and through traffic on the local street is prevented.

Effects or Impacts

<table>
<thead>
<tr>
<th>Volume</th>
<th>Reportedly effective in reducing volume if the turning movement prevented is a significant contributor to overall traffic on the local street.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Speed</td>
<td>Minimal impact on speed, except if the street was formerly used as a high speed through route.</td>
</tr>
<tr>
<td>Noise Energy, Air Quality</td>
<td>Noise reduction associated with the energy reduction in volume can be expected on the local streets.</td>
</tr>
<tr>
<td>Safety</td>
<td>Channelization tends to increase safety of locations where the design is easily understood.</td>
</tr>
<tr>
<td>Uniform Standards and Warrants</td>
<td>Similar channelization techniques covered in the MUTCD.</td>
</tr>
<tr>
<td>Reaction Community</td>
<td>Although community reaction is generally favorable, complaints do occur if frequent violations occur.</td>
</tr>
</tbody>
</table>
**DIAGONAL DIVERTER Typical Application**

Effective as part of a system of devices which discourage or preclude travel through a neighborhood by breaking up traffic patterns associated with a grid street system. Individual or limited use can cause traffic to shift to another street or neighborhood.

**Effects or Impacts**

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Volume</td>
<td>Studies have shown that traffic volumes can be reduced from 20 to 70 percent when used in conjunction with other diverter systems. They are less successful, however, if used with passive techniques such as stop signs, yield signs, or traffic circles.</td>
</tr>
<tr>
<td>Speed</td>
<td>Reportedly, speeds are only reduced in the immediate vicinity of the diverter. However, substantial reductions in speed may be noticed if the diverters cause a breakup of high speed through routes.</td>
</tr>
<tr>
<td>Noise Energy, Air Quality</td>
<td>Noise reduction associated with the energy reduction in volume can be expected on the affected local streets.</td>
</tr>
<tr>
<td>Safety</td>
<td>Before-and-after studies of accident rates on streets with diverters show a substantial reduction in accidents after the installation of diverters. System wide accident experience, however, reportedly remains the same.</td>
</tr>
<tr>
<td>Uniform Standards and Warrants</td>
<td>Not specifically listed in the MUTCD. However, diverters may be considered a channelizing island, being constructed and marked as such.</td>
</tr>
<tr>
<td>Reaction Community</td>
<td>Residents of areas where a substantial number of diverter systems are used are generally in favor of them; residents in other areas are generally opposed. This is substantiated by a vote in Berkeley, California. Residents in areas of the city that had few diverters, voted for the removal of them; residents in areas with frequent diverters, voted against their removal.</td>
</tr>
</tbody>
</table>
INTERSECTION CUL-DE-SAC AND MID-BLOCK CUL-DE-SAC Typical Application

Effective in areas near high traffic generators where the residents are less concerned about access by emergency vehicles than they are about excess traffic. Also found to be effective in areas where other diversion methods are frequently violated.

**Effects or Impacts**

- **Volume**: Reported to be extremely effective in reducing traffic volumes.
- **Speed**: Speeds are reduced if the cul-de-sacs cut off a formerly used through route.
- **Noise, Energy, Air Quality**: Noise is reduced as a function of traffic reduction.
- **Safety**: Safety is enhanced on the local street based upon the reduction in volume.
- **Uniform Standards and Warrants**: Acknowledged in basic traffic engineering texts and in practice.
- **Reaction Community**: Generally favorable on the streets where they are used; disliked by others in the community if traffic is shifted to their street, or if long detours are caused. Emergency service access can be provided through removable or flexible barriers, or through tire track passages.

**Descriptions**

Cul-de-sacing is commonly used and is a very effective way of eliminating nonlocal traffic on a street. There are inherent problems in closing a street, however. The response time of emergency vehicles may be increased. Residents will have only one way to/from their street, which may be a problem if the street intersects with an arterial. If unwanted through traffic is a persistent problem, and a high violation rate is noted with other traffic devices, cul-de-sacing may be an alternative. Cul-de-sacs can be landscaped to add to the environment of the street and may add to the feeling of community.
### SPEED HUMP and SPEED TABLE-Typical Application

Effective as a speed and volume reduction technique on local streets with limited truck traffic.

**Effects or Impacts**

<table>
<thead>
<tr>
<th>Volume</th>
<th>We have found the volume of traffic did not change as expected. The same volume of traffic continued to travel through the neighborhood, but at slower speeds, with the exception of some isolated speeding.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Speed</td>
<td>A single speed hump or speed table can reduce the 85th percentile speed between 14 to 20 mph at the device itself, with normal speeds returning soon after the encounter of the hump. A series of humps (undulations) with spacing less than 600 feet will reportedly have an increased effect on speed reductions.</td>
</tr>
<tr>
<td>Noise, Energy, Air Quality</td>
<td>Reportedly, some reductions in noise energy levels can be experienced on low-volume streets. Noise levels can actually increase if there is substantial truck traffic on the street.</td>
</tr>
<tr>
<td>Safety</td>
<td>There has been a great deal of debate and discussion as to the impact undulations have on vehicle safety. While felt by some engineers to be a serious hazard, a study by a subcommittee of the California Traffic Control Devices Committee found that with between 150 and 200 million crossings of the state's 150 to 160 undulations, very few claims for damages had been filed due to the undulations.</td>
</tr>
<tr>
<td>Uniform Standards and Warrants</td>
<td>Not covered by the MUTCD, but recently accepted by the Institute of Transportation and Engineers.</td>
</tr>
<tr>
<td>Reaction Community</td>
<td>Mixed reaction has been noted. Local residents note an apparent decrease in speed, and like them because they feel that speed humps/speed tables are the least expensive approach to their problems.</td>
</tr>
</tbody>
</table>
**FLUSH CHICANE-Typical Application**

Typically a series of at least three curb extensions, alternating from one side of the street to the other, forming S-shaped curves. At intersections, also called neckdowns or bulb-outs. At mid-block, also called deviations or chokers. Works well with speed humps, speed tables, raised intersections, textured crosswalks, pedestrian crossings, and raised median islands.

### Effects or Impacts

<table>
<thead>
<tr>
<th>Volume</th>
<th>Minor decrease in traffic for two-lane and 20 percent reduction for one-lane chokers. Most effective with equivalent volumes on both approaches. Maneuvering through chicanes may reduce the comfort level of some motorists, encouraging them to take an alternative route.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Speed</td>
<td>Effective as a speed reduction technique on local streets. Speeds have typically been reduced on average by 4 percent for two-lane chokers, and 14 percent for one-lane chokers.</td>
</tr>
<tr>
<td>Noise, Energy, Air Quality</td>
<td>Adequate drainage is a key consideration. Provides opportunity for landscaping. Street sweeping may need to be done manually. Can impact parking and driveway access.</td>
</tr>
<tr>
<td>Safety</td>
<td>No effect on street access. One-lane chokers/chicanes rely on regulatory signs and driver courtesy to work. Preferred by many fire department/emergency response agencies to most other traffic calming measures. Emergency response typically prefer two-lane chicanes to speed humps. Reduces pedestrian crossing width and increases visibility of pedestrians. Chinanes require motorists to make a turning maneuver to travel through the chicanes, making it more difficult to pass through them at higher speeds.</td>
</tr>
<tr>
<td>Uniform Standards and Warrants</td>
<td>Some applications use an island which allows drainage and bicyclists to continue between the choker and the original curb line. Typically designed to narrow the road to 20 feet for two-way traffic. RPM's and bollards or object markers are used to make chicanes visible to motorists.</td>
</tr>
<tr>
<td>Community Reaction</td>
<td>Chicanes give the impression of a narrower road, slowing down drivers as they maneuver through the devices.</td>
</tr>
